

SARGON How To Build Model Driven Robots

Martin Azkarate w/ the kind collaboration of SARGON consortium

8th December 2016, MBSSE Workshop

ESA UNCLASSIFIED - For Official Use

Let me quickly introduce myself...

ESA UNCLASSIFIED - For Official Use

ESA | 01/01/2016 | Slide 2

...In a nutshell, developing robotics onboard SW poses several challenges, especially due to their **criticality** and the complexity that grows with the level of **autonomy**.

The use of formal methods is increasingly popular (i.e. necessary), and **Model-Based** techniques are being developed/studied in many robotics applications.

SPACE AUTOMATION & ROBOTICS GENERAL CONTROLLER

Activity to design a Robot Control Operating Software (RCOS) with special care on RAMS requirements and re-usability at different implementation phases.

Robotic control application software		FDIR
		Monit oring, TM/TC
Consistent data types	API (open standard)	

Generic schematic	Middleware (tasks communication, run-mode change)			
representation of a RCOS.	Operating system (task scheduling, hard/soft RT)	Avionics bus drivers (CAN,	File system	Low level device
	HW abstraction	Ethernet)		driver

The set of th

TO REDUCE THE GAPS BETWEEN DIFFERENT ROBOTICS DEVELOPMENTS

 In Space, ExoMars or European Robotic Arm (ERA) require significant software engineering effort compared to other satellite missions, due to complexity and low heritage.

SW tools used are highly customized -> very little percentage of this software development, validation and verification effort becomes re-usable.

- In Industry, commercial closed source solutions customized for their HW/products. Reliable, but far from getting to standardization, being portable or achieving inter-operation.
- In Academia, the trend is to use robotics SW frameworks (ROS, Rock, ...), which allow fast prototyping and testing for R&D activities but far from RAMScompliant -> Transitions to reliable applications require extensive recoding.

TASTE – A MODEL-DRIVEN APPROACH

- TASTE provides a model-driven approach for the development of reusable and RAMS-compliant on-board software.
- SARGON focuses on the analysis and definition of requirements for an RCOS and on identifying the building blocks to complement the current TASTE implementation for covering all needed RCOS functionalities.
- The aim of this TASTE RCOS is to be the **base of future European space robotics applications**, and in this context SARGON is a first step in that direction.

Building Blocks

ADAPTATIONS TO TASTE TO MAKE IT ROBOTICS FRIENDLY

- Importing of legacy code, C/C++ libraries
- Rock2Taste & Taste2Rock: Transformations between Platform Independent Models and Platform Dependent Implementations.
- Robotics Data types into ASN.1
- Monitoring & Control of 2D & 3D data:
 - Robot Data Visualization (Vizkit)
- Robot kinematics modelling (URDF)
- Robotics Simulator (Mars)
- Component Life-Cycle:
 Re-usable skeleton implementing the component run-mode state-machine.

Monitoring of 2D & 3D data in Vizkit

TWO PROTOTYPE IMPLEMENTATIONS

As Taste gets robotics-complemented we plan to design and deploy two prototype implementations, addressing different levels of RAMS requirements (form lower to higher constrains). Both will be using the ExoTeR lab rover platform.

- Lab-quality:
 - Target HW: PC104 embedded computer (Intel x86) running Ubuntu.
 - Features to implement: Locomotion, stereo camera acquisition and telemetry visualization.
- Space-quality:
 - Target HW: GR712RC Leon3 board running RTEMS.
 - Features to implement: Locomotion and telemetry visualization.

Programmatic

SARGON is an activity funded by the ESA Basic **Technology Research Programme** (TRP). The activity was started in January 2016 and is planned to conclude in summer 2017.

While the activity is ongoing, it has already been successful in securing a continuation. The **EC H2020** programme, within the Strategic Research Cluster in Space Robotics, has awarded an operational grant to the **ESROCOS** team for the further development of **SARGON**.
