

Operation Preparation Environment (OPEN)

Workshop on Simulation and EGSE for Space Programmes (SESP 2017)
ESA-ESTEC, Noordwijk, The Netherlands

Francois Trifin

30/03/2017

ADM-Aeolus	GAIA	Sentinel-1B
BepiColombo	GALILEO LEOPs	Sentinel-2A
Cluster II	Integral	Sentinel-5P
Cryosat-2	LISA Pathfinder	Sentinel-3A
EarthCare	Mars Express	Sentinel-6
Euclid	METOP-C LEOP	Solar Orbiter
ExoMars TGO 16	Seosat	Swarm
ExoMars ESP 20	Sentinel-1A	XMM-Newton

OPEN - Context

- No coherent and complete solution supporting the mission operators in their tasks related to operations preparation
- A large variety of tools which cannot be easily integrated and follow different technologies, governance cycles & principles
 - Some tools are proprietary
 - No synergy between the spacecraft and ground station operators communities
- Significant effort to generate and manage the mission information artifacts
- Effort to develop a fully fledged solution covering all use cases in a way which enables an effective user productivity is considered very high
- Future generation missions will be based on the new mission control system kernel (European Ground Systems Common Core - EGS-CC) and associated data model

How can we improve?

OPEN - Objectives

- The ideal **goals** of an Operation Preparation Environment are:
 - **streamline** the mission operations preparation activities and enable a **reduction of the required efforts** by operators
 - provide a **consistent environment** where all applications related to operations preparation can be hosted and **avoid proliferation of heterogeneous implementations**
 - **harmonize** the tools used by the **spacecraft and ground stations operations teams**
 - extend the support of **advanced features** (e.g. configuration management) **to all artifacts** related to mission operations
- A secondary objective is to **support the transition** from the current generation Mission Control System Infrastructure (**SCOS-2000**) to the future generation (**EGS-CC based**) of ground data system infrastructure

A **rich client platform** (RCP) is a programmer tool that makes it easier to integrate independent software components

Eclipse RCP

RCP Plugins

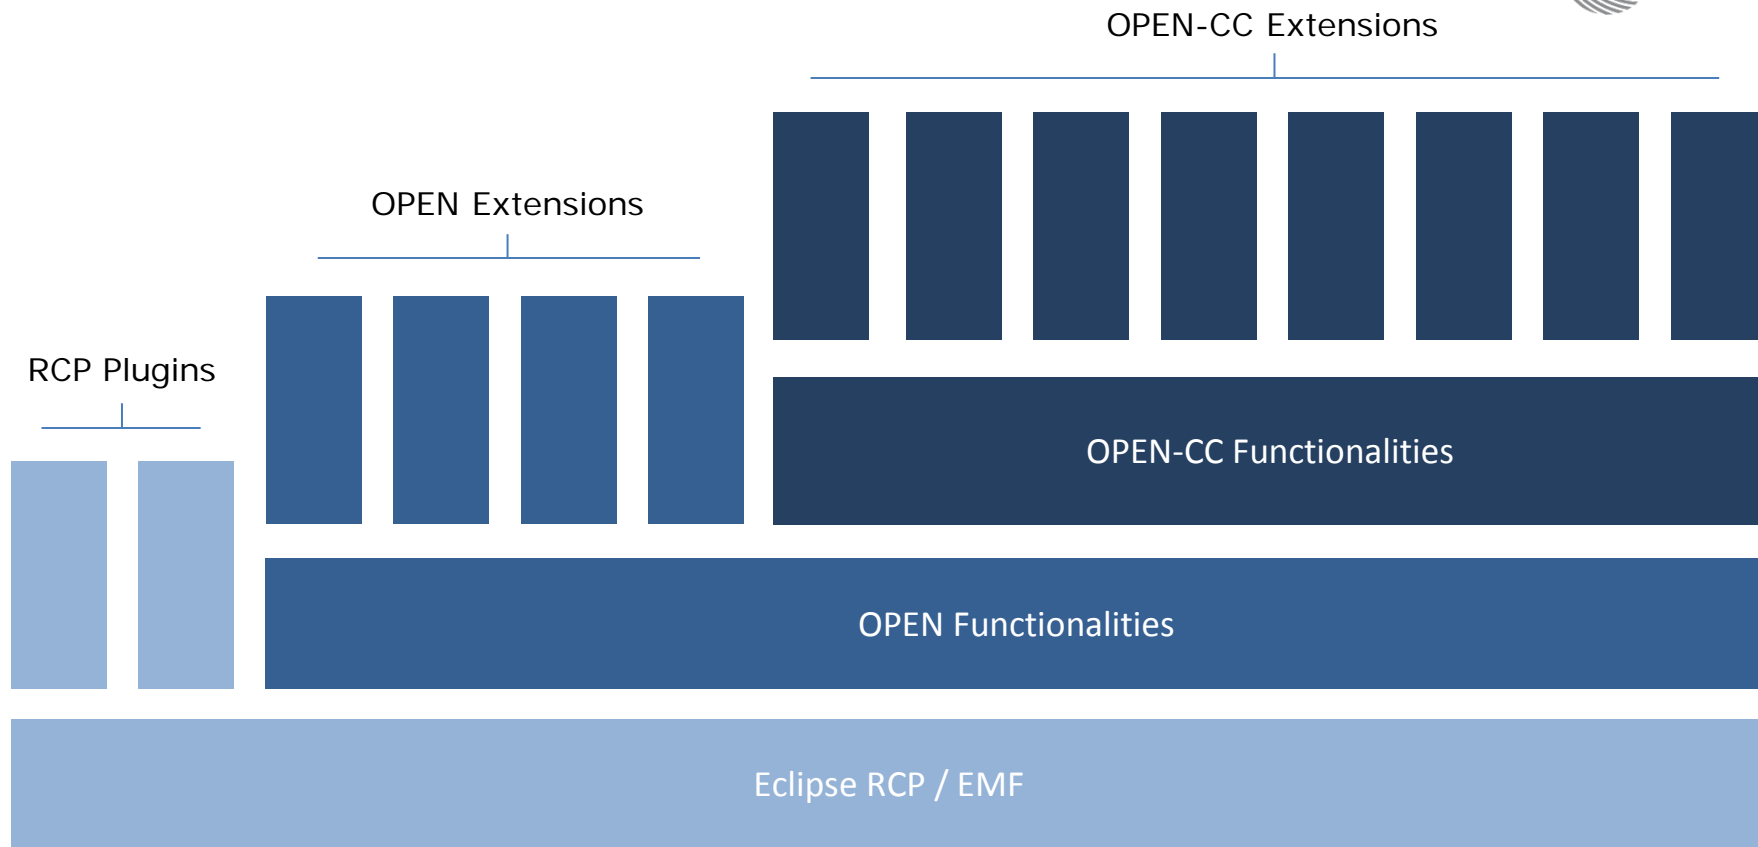

OPEN Functionalities

Eclipse RCP / EMF

OPEN-CC Functionalities

OPEN Functionalities

Eclipse RCP / EMF

OPEN – Core principles

- The basic idea is to define, develop and deliver a **unified environment** where all operators tasks related to mission operations preparation can be efficiently supported
- The environment will support the ability to deploy specialised '**extensions**' which are **specific of a given data type** but interact with the framework e.g. to make use of data sets generated by other extensions
- The OPEN framework will support the **common operations** for all data types of operators relevance
- The strategic agreement is that the framework will support the **EGS-CC** data model to serve the future generation missions (EGS-CC based)
- The **extensions** providing the actual 'user front-end' functionality may originate **from several sources** (funding and organisational)

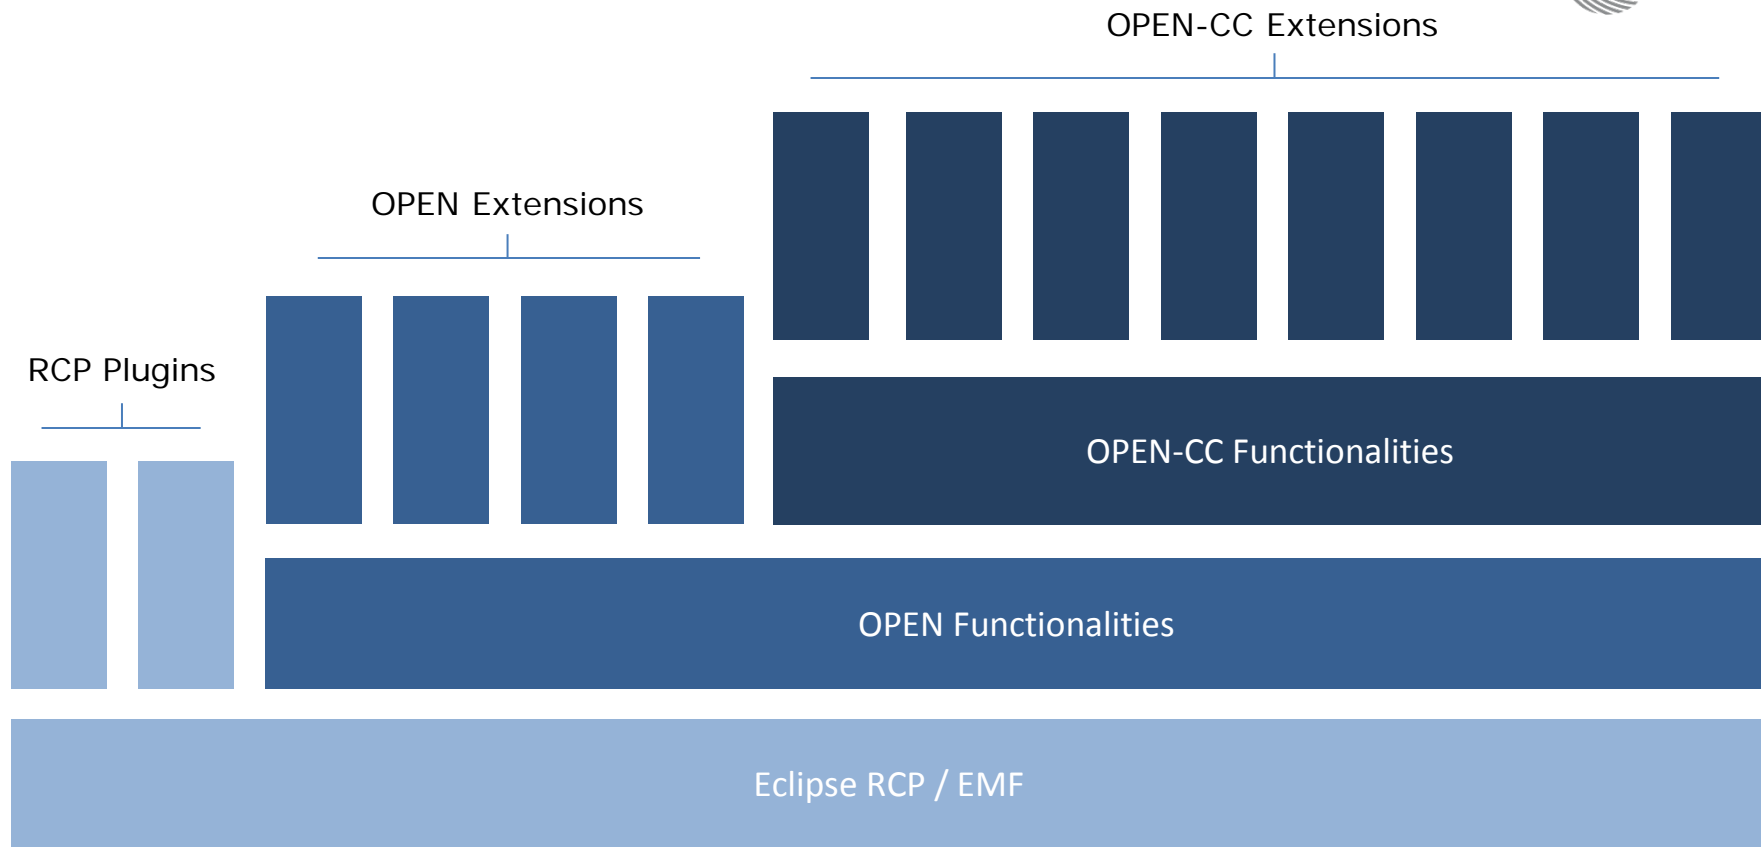

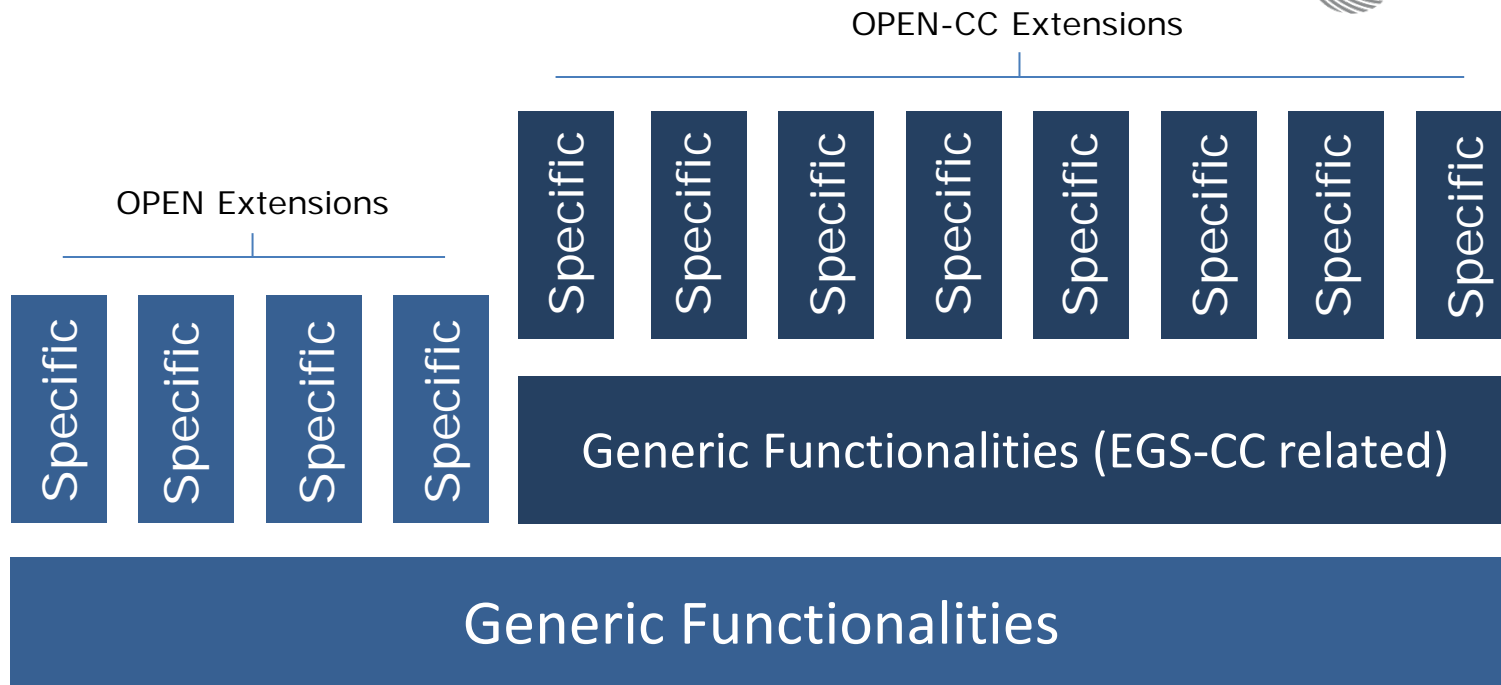

Technically

- Eclipse Plugins
- OGSi

Functionalities

- Version Control
 - Workflow Management
 - Import/Export
 - Data/Model Migration
 - Model Explorer, Search
 - Consistency Check Management
 - Generic Model Object Editor
 - Compare & Merge (also EMF)
 - Model query, batch processing
 - Dependency exploration
 - Diagramming
 - User Management
 - ..
- EGC-CC CDM Data Management
 - CDM Views (MCM View, CI View, Category and QUDV Model View, ..)
 - Monitoring & Control Data Definitions
 - Constraints Management (OCL) – CDM Check, Mission Specific Checks
 - Data Management in CI Groups and CI Assembly
 - Mapping Management
 - CDM Search
 - ..

ESOC Preparation Environments

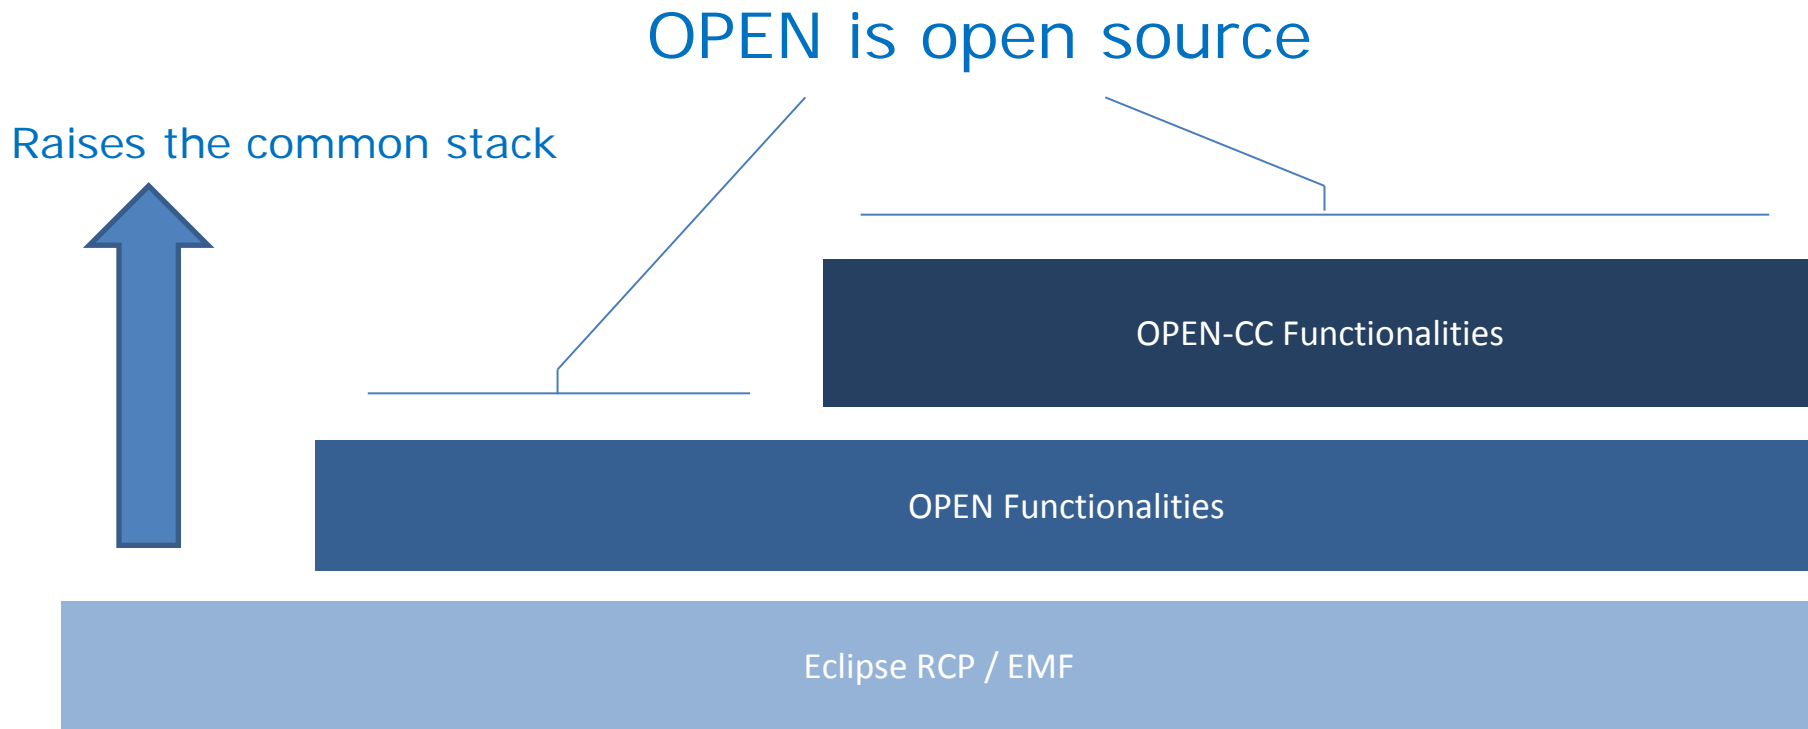

Where is the novelty?

OPEN-CC Functionalities

OPEN Functionalities

Eclipse RCP / EMF

Where is the novelty?

OPEN - Implementation

- The framework is implemented in Java with compatibility to Linux, macOS and Windows
- Using a model based development approach, the framework relies on the Open Services Gateway initiative (OSGi) modular system and the Eclipse Rich Client Platform
- OPEN Extensions are developed as set of Eclipse plug-ins
- OPEN's data is stored and exchanged using a distributed version control system
- The framework is to be used as backbone framework for specific preparation environments, such as for
 - MICONYS-CC (spacecraft operations)
 - GSMC-CC (ground station operations)
- Final applications are delivered to users as desktop applications

OPEN – Example of basic functionality

- **Version Control** : Distributed revision control system (DRCS)
- Allows users to work productively when not connected to a network
- Communication is only necessary when sharing changes among other peers
- **Numerous different workflows are possible**
 - One or multiple "central" repositories possible
 - Permits centralised control of the data
- **Full traceability,**
 - between partner organisations
 - between members of the same team
 - > **Allow efficient exchange (comparison and merge)**

Distributed data management

OPEN - Timeframe

- Overall Specification and Design finished
- Reusable prototyping done with previous and on-going activities
- Implementation starts 04/2017 with multiple companies
- Agile development with multiple releases in 2017 and 2018

OPEN – Conclusion

- Operation Preparation Environment (OPEN)
 - New modern software framework
 - Goal: Provision of streamlined, consistent, unified preparation environments for spacecraft and ground stations operations teams to manage operations data required to tailor/operate the ground data systems
 - Mainly targeted towards EGS-CC systems, models and data
 - Extensible by third parties
 - Foreseen users
 - All future EGS-CC based ESA/ESOC missions
 - Licensed to third parties under ESA open source or community software license (allow commercialisation)

The Next Generation Mission Operations Preparation Environment at ESOC
