D-SAT MISSION: an In-Orbit **Demonstration** of Satellite Controlled Re-entry

Alessio Fanfani

Clean Space Industrial Days October 26th 2017 – ESA-ESTEC

D-SAT Mission Description

THE MISSION

D-SAT HAS BEEN DESIGNED TO BE THE FIRST SATELLITE TO BE REMOVED IN A QUICK, SAFE AND CONTROLLED WAY BY AN INDEPENDENT DECOMMISSIONING DEVICE

D-SAT is a miniaturized satellite featuring a zero-singlepoint-of-failure and full redundant architecture. It hosts two experiments that are tested during the first two months of operations in orbit.

D-ORBIT DECOMMISSIONING DEVICE (D3)

AUTONOMOUS

Power and telemetry-independent from the host satellite during the decommissioning maneuver

RELIABLE

All the most sensible subsystems have already reached space qualification

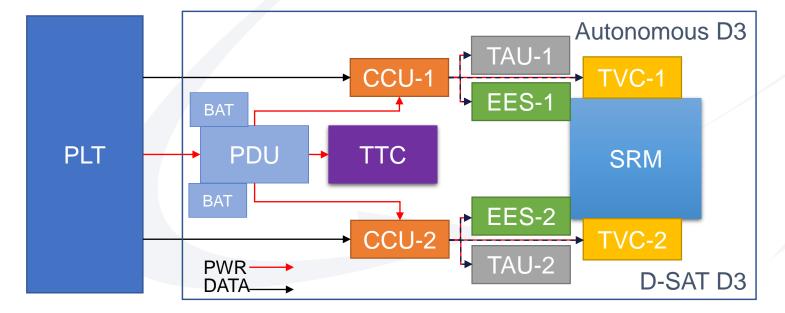

FLEXIBLE

Compact design, easier to be integrated in satellite system and customizable to customer's need

SAFE

Complaint with the major safety standard and requirement NASA, ESA and MIL-STD

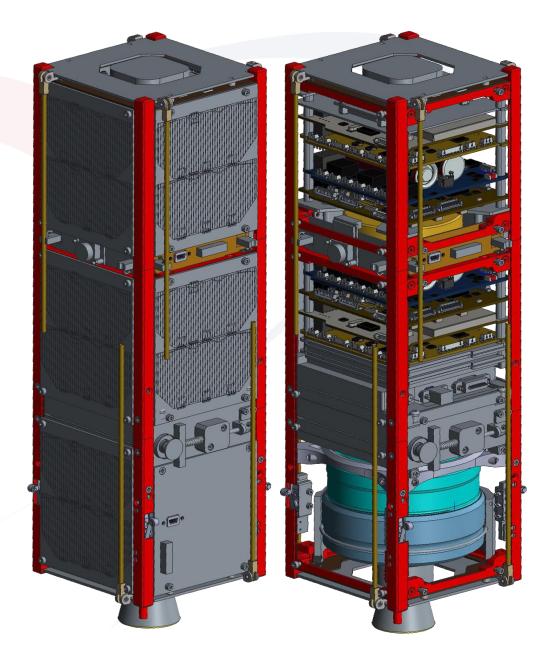

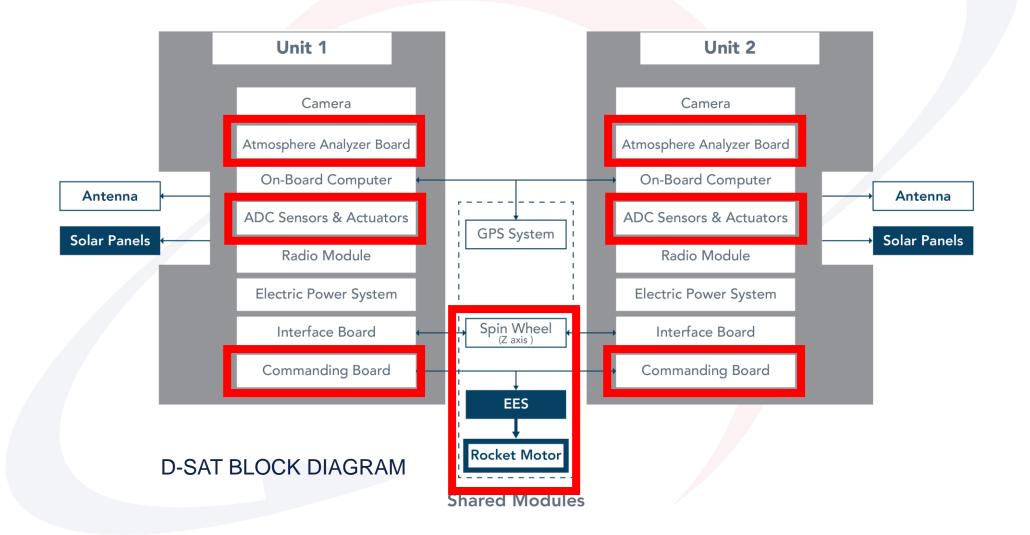

CDF ESA CleanSat Technology Assessment: Building Block 14 - Autonomous De-Orbit System

THE SPACECRAFT

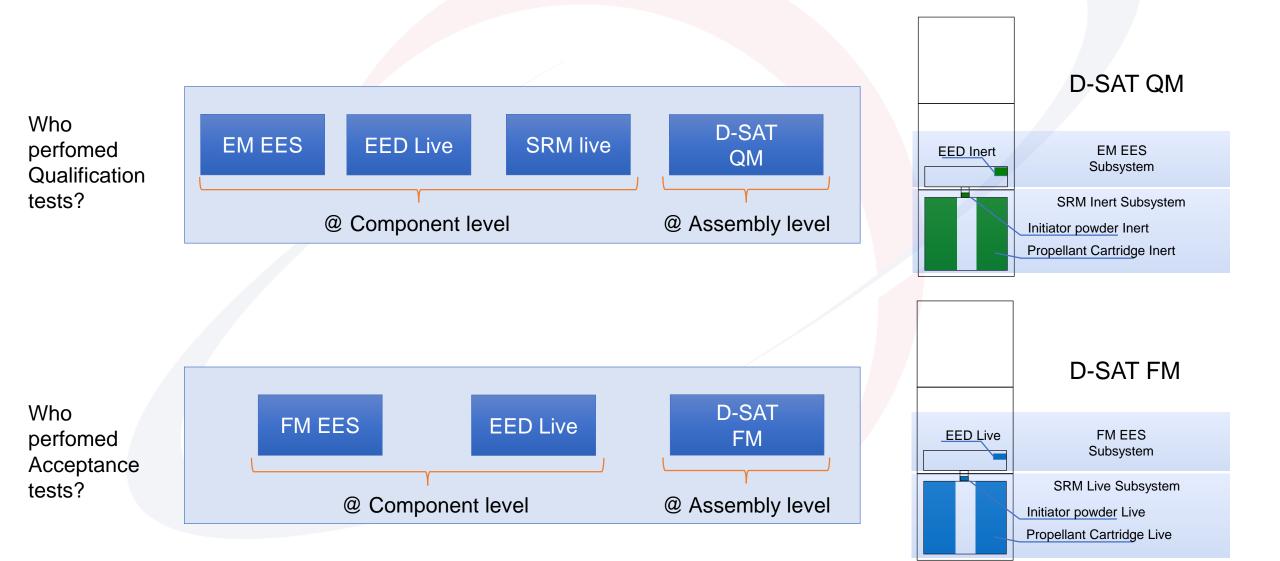

- D-SAT is a 4,3 kg nano-satellite (100x100x340 mm) composed by two main elements:
- the Platform, a complete, standard CubeSat system;
- the Decommissioning Device, with an independent electric power system, on-board computer and attitude determination and control system. The decommissioning device features a Decommissioning Motor, to provide the propulsive thrust for the deorbiting maneuver.

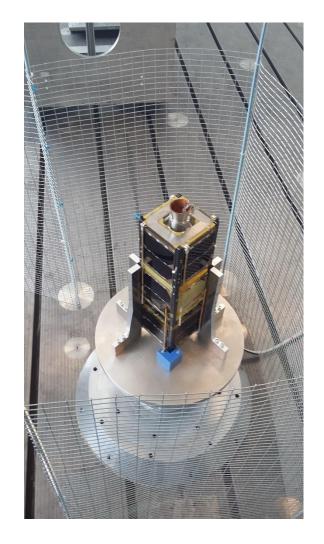

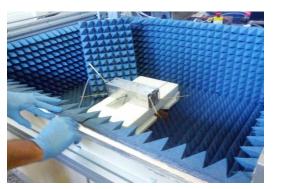

THE SPACECRAFT

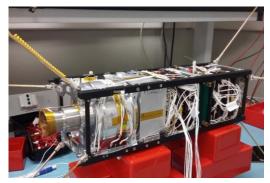

D-SAT VERIFICATION PLAN

Acceptance Q4 2016

Launch PSLV C-38 23rd June, 2017

D-SAT Innovative Sub-system

D-SAT - ELECTRO EXPLOSIVE SYSTEM (EES)

EES function is to ignite the rocket motor through an Electro Explosive Device (EED) in a safe and controlled way.

MAIN FEATURES:

- Designed according to MIL-STD-1576 standard
- Mechanical barrier with a double lock architecture
- Four electronic barriers to avoid inadvertent EED ignition
- Hermetically sealed metallic box against EMI, humidity, explosive atmosphere and external fire
- Safing plug connector and additional mechanical provision for a safe ground handling
- Operate temperature range -34 / 71°C
- Cubesat Form Factor

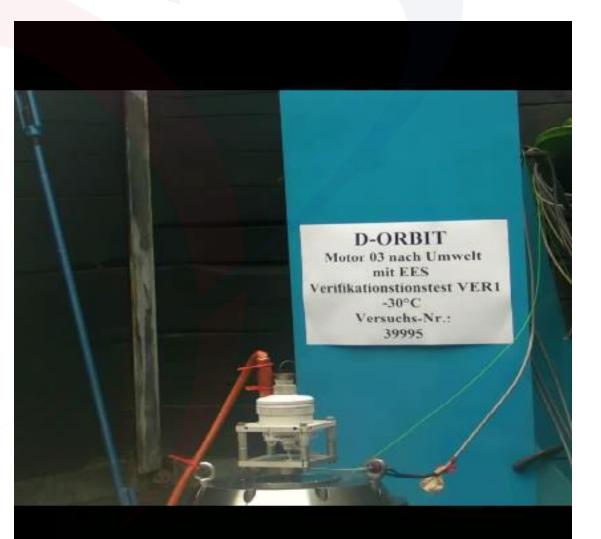

D-SAT - SOLID ROCKET MOTOR (SRM)

D-SAT propulsion system consists of a small Solid Rocket Motor delivering about 750 Ns total impulse to the satellite. It uses about 300 grams of **non-metalized** composite propellant based on ammonium perchlorate (AP) and binder (HTPB).

CONSTRAINT:

 Fixed nozzle: Thrust-vector control systems didn't satisfy programmatic and technical requirements. It imposed D-SAT to be spin-stabilized during firing and strict mounting tolerance.

D-SAT – SRM ALIGNMENT TEST

REQ: The alignment error between SRM Nozzle axis and D-SAT's CoG shall be lower than 1.5 mm

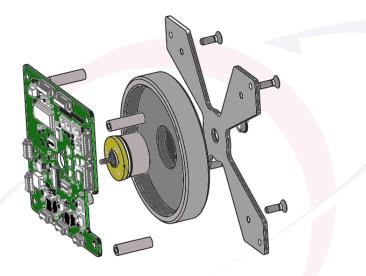

Fig. 2: Final Assembly alignment

Fig. 3: Lasers alignment Check

Fig. 4 & 5: D-SAT Alignment Test

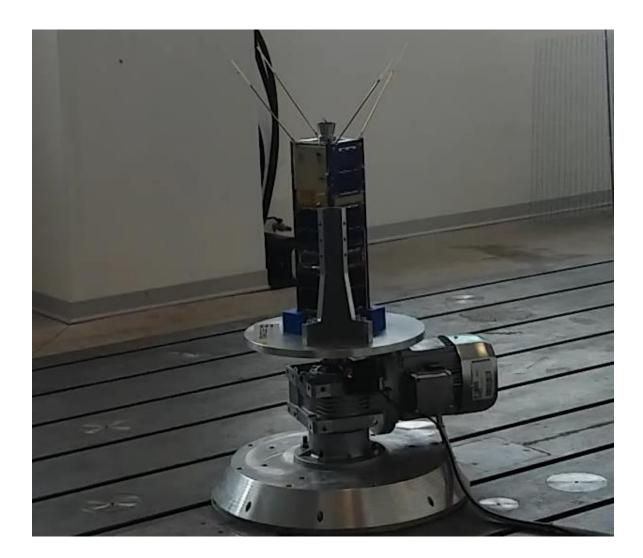

The D-SAT spin wheel system provides an angular momentum for spinning the satellite up to 400 rpm (6.6 Hz).

MAIN FEATURES:

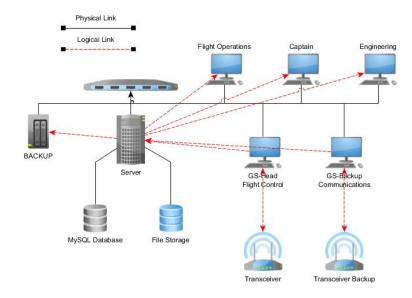

- Mass = 200 g
- Momentum of inertia, Ir = 1.8 [kg cm²]
- Angular Velocity, $\omega = 16000$ rpm

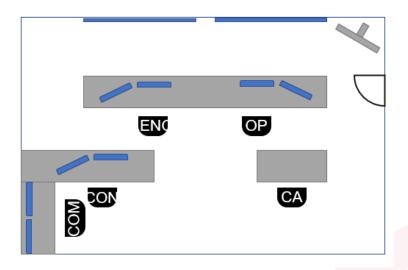

D-SAT - SPIN WHEEL

- Completely developed in-house
- With point-and-click user interface
- Interfaces directly with TNC, ground station hardware and remote database
- Real-time update of telemetry and plotting utility

- Implementing reconfigurable color-code and format for all windows
- Allows multiple telemetry frames and units (i.e. satellites) information merge and filtering
- Database suitable for MATLAB export and postprocessing

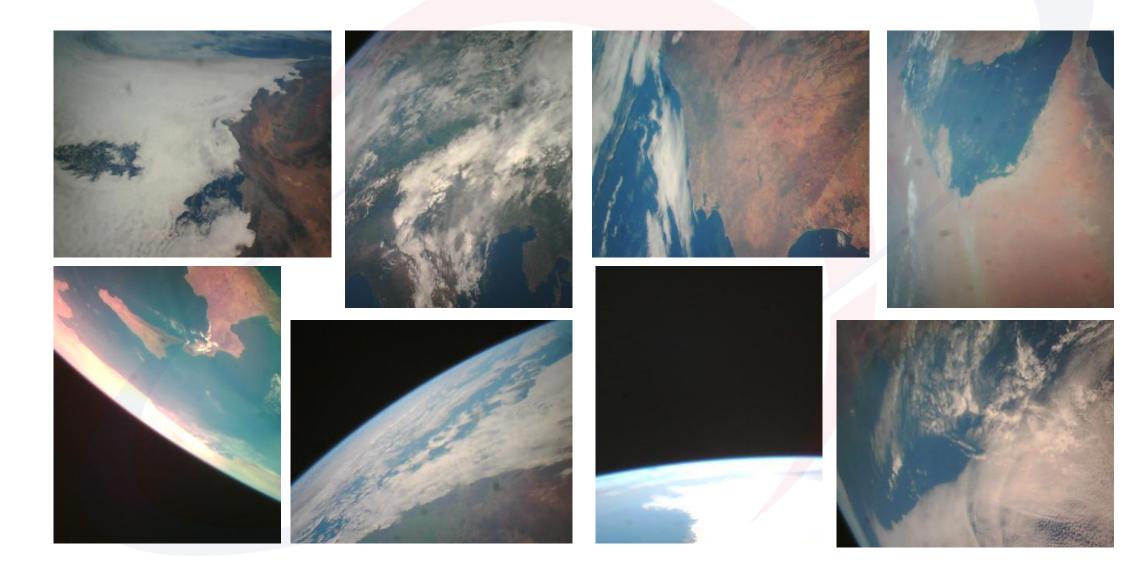

D-SAT OPERATIONS

Phase	Start	End	Description
LEOP and Commissioning	23 Jun	01 Jul	During LEOP, the telecommunication link has been acquired, frequency characterized and health status confirmed. Systems testing and characterization has been carried out.
ADCS Calibration	01 Jul	15 Jul	In this phase, sensors and actuators was deeply tested, calibrated and characterized, and ADCS performance have been verified by means of testing pointing manoeuvres.
Experiments Campaign	15 Jul	08 Aug	During these weeks, the partner's experiments have been conducted
Earth-Imaging Campaign	08 Aug	25 Aug	In these weeks of Earth-imaging campaign, a number of Earth pictures have been taken and downloaded, mainly for outreach purposes.
Testing for Decom. Manoeuvre	25 Aug	Sep. 2017	In this phase, multiple testing to prepare the system for the decommissioning manoeuvre and to allow precise mission analysis for the deorbiting have been conducted.
Decommissioning Maneuver	2nd of	f Oct 2017	In this final (and very short) phase, the spacecraft will be removed (see Section 4.2.8) by activating the D-Orbit Decommissioning Device

Mission Schedule

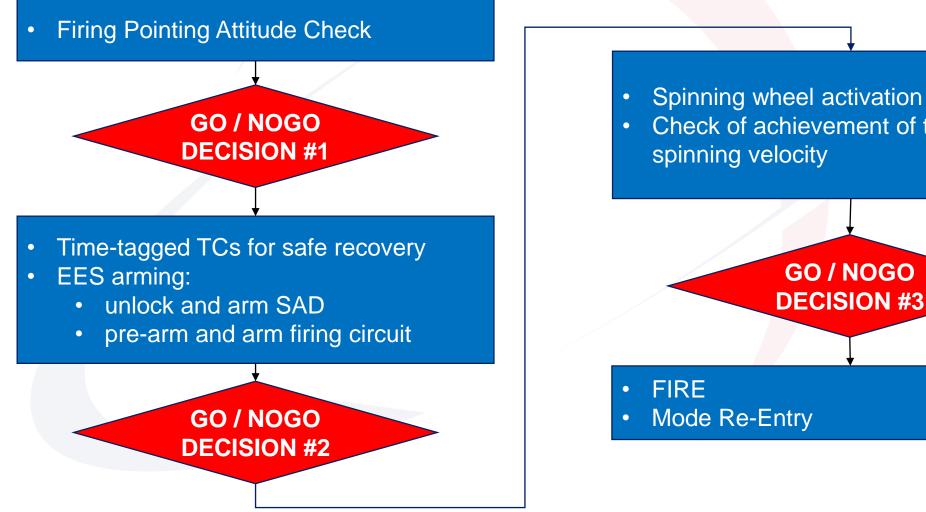

EARTH IMAGING CAMPAIGN

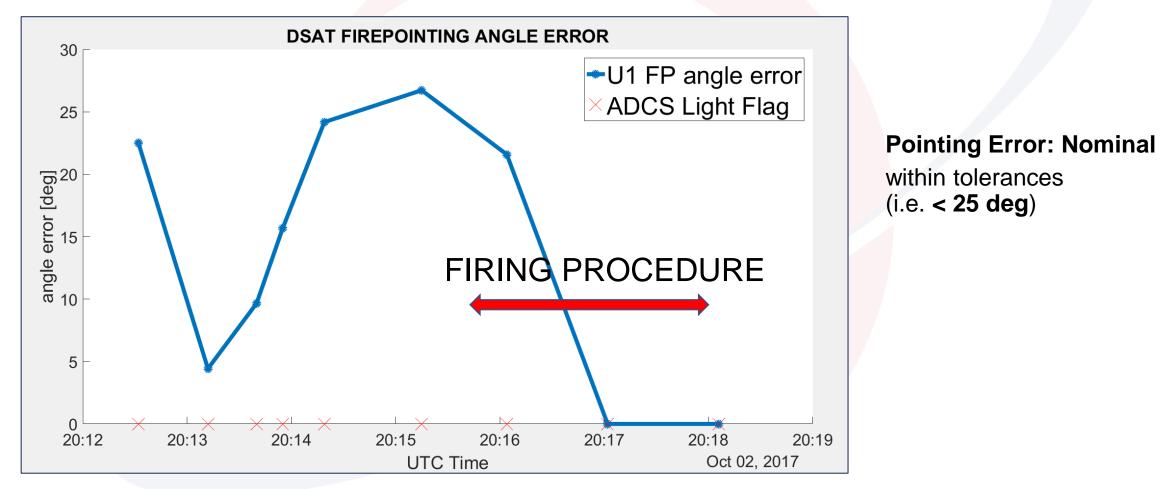

D-SAT Disposal Manoeuvre Analysis

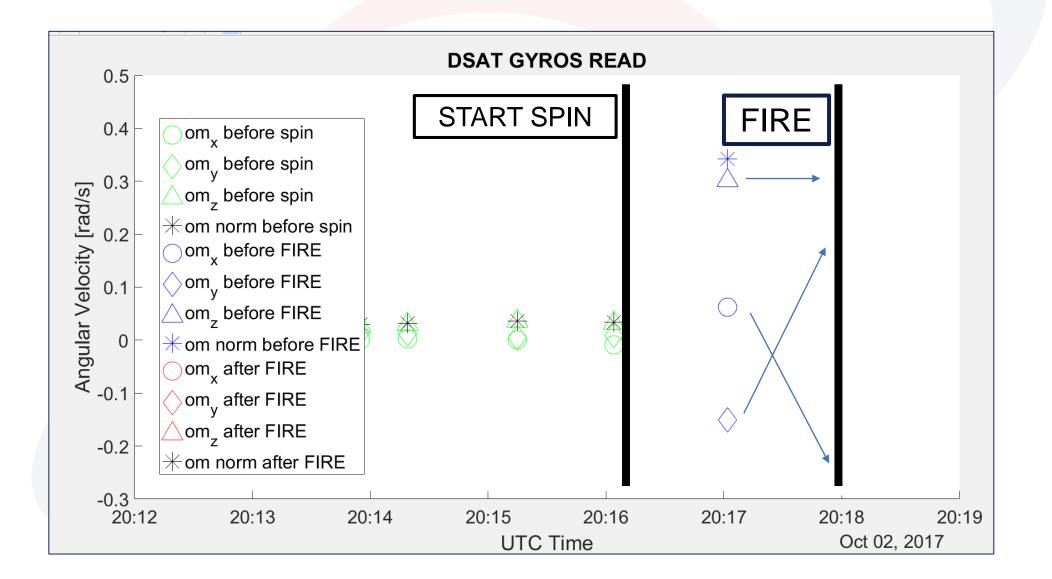

Steps of the Firing Procedure in chronological order:

- Spinning wheel activation
- Check of achievement of target spinning velocity

Red = original orbit

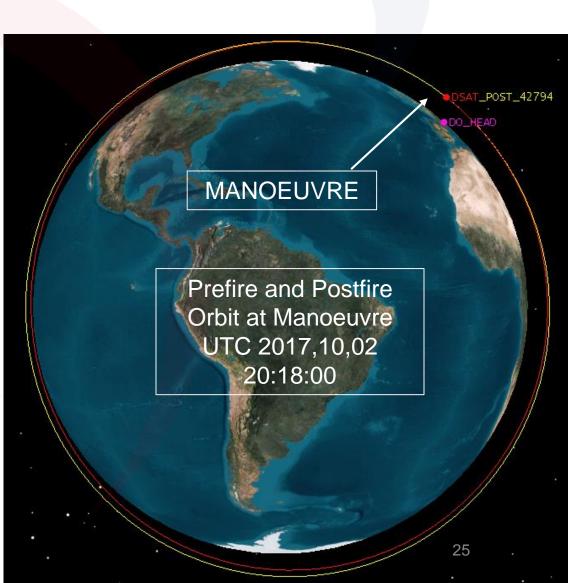

Perigee = 503 km Apogee = 514 km Inclination = 97.4388 deg

Yellow = post-fire orbit

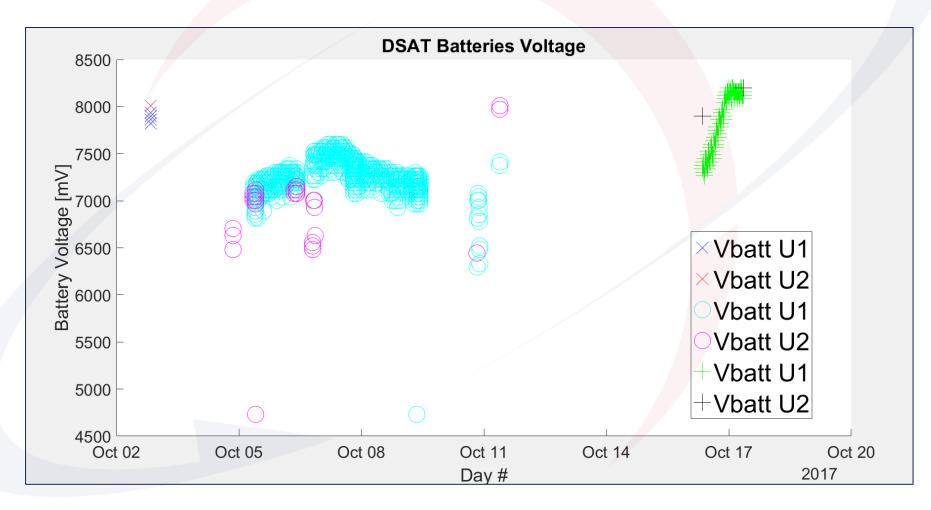

Perigee = 513 km Apogee = 692 km Inclination = 97.6306 deg

Tot DV provided ≈ 70 m/s

Against ideal 180 m/s

D-SAT Survived: EPS and Batteries Status

D-SAT RESULTS & LESSON LEARNT

Conclusions

- 1. The D-SAT disposal manoeuvre was not nominal because:
 - Mounting misalignments of SRM within satellite structure (tolerances in this regards were critically < 1.5 mm);
 - Possibly combustion instabilities, which may deviate the thrust vector during the fire.

2. Possible mitigations:

- Thrust misalignments could be assessed both during SRM verification and during D-SAT qualification campaign via dedicated firing test on thrust vectoring bench.
- 3. The D-SAT post-fire orbit is about 100km higher than the original one and with 0.2deg delta-inclination (still compliant with the 25-year rule)
- 4. All Decommissioning Device's sub-systems was verified in space.

D-SAT: RESULTS AND LESSON LEARNT

D-SAT has been the first CubeSat:

- 1. With a completely redundant avionic's architecture;
- 2. With a pyrotechnic device compliant with the MIL-STD-1576 standard;
- 3. To maintain a stable communication link during the spin-stabilizing prefiring phase when it was rotating on its axis at 400 rpm;
- 4. To survive after firing of a solid rocket motor with a total impulse of 750 Ns (a very high trust for such a small satellite);
- 5. To perform an orbital maneuver with a delta-velocity of 70 m/s.

D-SAT: RESULTS AND LESSON LEARNT

Thanks to D-SAT Mission, D-Orbit has:

- 1. Demonstrated in space its Decommissining Device's features: Autonomy, Safety and Reliability and reached the TRL 9;
- 2. acquired capabilities in nanosatellite manufacturing, validation and testing, both software and hardware;
- 3. acquired experience in nanosatellite operations;
- 4. acquired capabilities in dealing with explosive materials and safety laws and regulations for storage, handling and transportation;

D-SAT: RESULTS AND LESSON LEARNT

Next D-Orbit's Activities:

- D-SAT mission highlighted the importance of TVC features for D3 designed for a direct reentry. D-Orbit is working with Almatech e Sitael, on a Thrust Vector Control system for Solid Rocket Motor under an ESA contract;
- 2. Focus on Autonomy;
- D-Orbit will integrate the same D-SAT's Decommissioning Device on its new satellite platform: the ION CubeSat Carrier – a CubeSat free-flying dispenser (first flight Q1 2019).
