# FAIRE working group report (software)

*by Mr. Andreas Jung (ESA/ESTEC)*

The SAVOIR on-board software architecture (OSRA) is now quite established, with a defined meta model and a supporting editor. Several technical documents are also describing the architecture and specifying the functions of the Execution Platform, this part of the on-board software that supports the application software for communication and real-time. The technical documents are gathered into a set of SAVOIR documents, including a generic specification of the execution platform. The presentation will show the status of the work.
