

Virtualisation @ESA (postponed)

Tuesday, 27 March 2018 - Wednesday, 28 March 2018

ESTEC

Scientific Programme

Many space disciplines will come together to talk about how virtualisation has helped improve data processing, dissemination and management. From meteorology to astrophysics. From spacecraft design to mission operations, we will hear many interesting hands-on examples of the way in which today the world has embraced concepts like Cloud and data distribution.

Special sessions on roadmaps and planning will try to predict the future as our world grows more complex and more interlinked. What is the next big step? How will artificial intelligence serve humankind? How much artificial intelligence should be used? How will professions evolve? All these questions and many others will be addressed during the workshop.
