NASA Shields-1: A Radiation Shielding Experiment Developed with Radiation Modeling

Dr. Larry Thomsen
NASA Langley Research Center, Advanced Materials and Processing Branch, 6A West Taylor Street, Hampton, VA 23681; 757-864-4211,
d.l.thomsen@nasa.gov

29 November 2018

NASA Langley Research Center

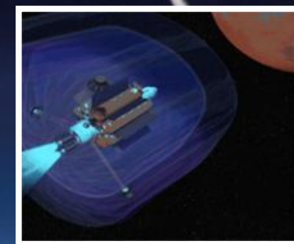
NASA Langley Research Center Hampton, Virginia
Founded in 1917 (NACA): first civil aeronautical research laboratory converted to NASA in 1958
Facilities: $3.6 billion replacement value
People: 1840 Civil Servants ; 1630 Contractors

NASA Langley Core Competencies

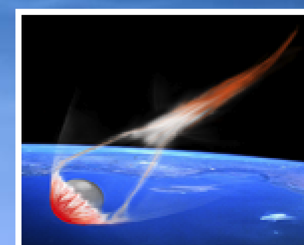
Aerosciences
Research for Flight in All Atmospheres

Characterization of all Atmospheres
(Lasers & LIDAR)

Aerospace Systems Analysis



Space Exploration
Entry, Descent & Landing



Aerospace Structures & Materials

Advanced Materials, Polyimide Resins and Composites

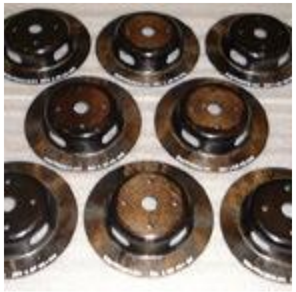
NASA LARC Advanced Materials R&D

<u>Maturation of PETI-5:</u>
Requirements Driven High Performance Adhesive and Composite Matrix Resin

- About 20,000 pounds of IM7/PETI-5 unidirectional tape prepared in the High Speed Research (HSR) program
- <u>Performance at 350°F for 60,000 hrs (previously unattainable)</u>
- Technology patented and licensed to 4 companies

PETI-5/IM7 Skin Stringer Panel (6 ft x 10 ft)

Polyimide Based R&D 100 Winners

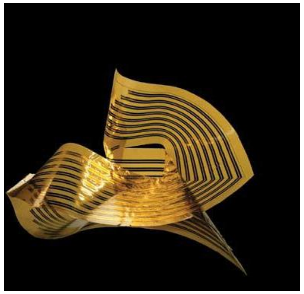


2005
PETI-330 High Temperature Resin

2001
TEEK
Polyimide Foam

2000
Macro Fiber
Composite Actuators

2000
Atomic Oxygen
Resistant Polymers



1996
LaRC -SI

Materials for Extreme Environments

- Extreme-Use Temperature Composites
- Radiation Shielding
- Refractory Ceramics
- Materials on The International Space Station Experiment (MISSE)

MISSE deployment on ISS, containing NASA LaRC Materials

LaRC Historical Space Materials Experiments

LDEF: Early Cargo for Space Shuttle
Near Real Time: 69 months actual (18 months planned)
Large Multimillion Project over 10 yrs from early Concepts: 1972 to Flight
Majority passive experiments, Each experimenter provided trays for the structure

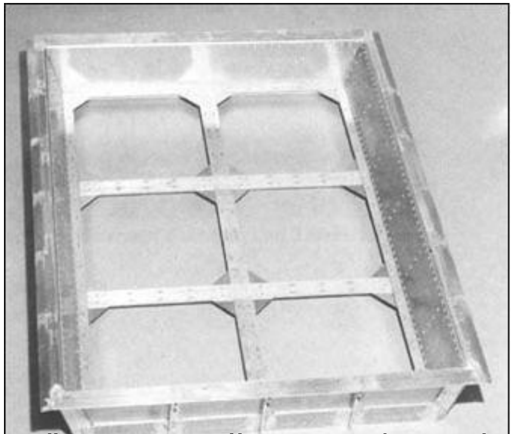
LDEF deployed on STS-41C, Apr. 6-13, 1984, (image credit: NASA)

LDEF retrieval on Jan. 12, 1990 (image credit: NASA/LaRC)

LDEF Dimensions and Mass

LDEF structure: 30 ft long x 14 ft diameter, 8000 lbs

Experiment Trays: each 34in x 50in typical
86 total (72 around cylinder, 14 on ends)
Experiment weights could be 180-200 lbs



(image credit: NASA/LaRC)

LDEF structure on a trailer (image credit: NASA/LaRC)

Total approximated mission weight: **21,400 lbs**

Ref: NASA SP-473, The Long Duration Exposure Facility (LDEF), Mission 1 Experiments

Materials International Space Station Experiment (MISSE)

Approximately 2ft x 2ft across for each half

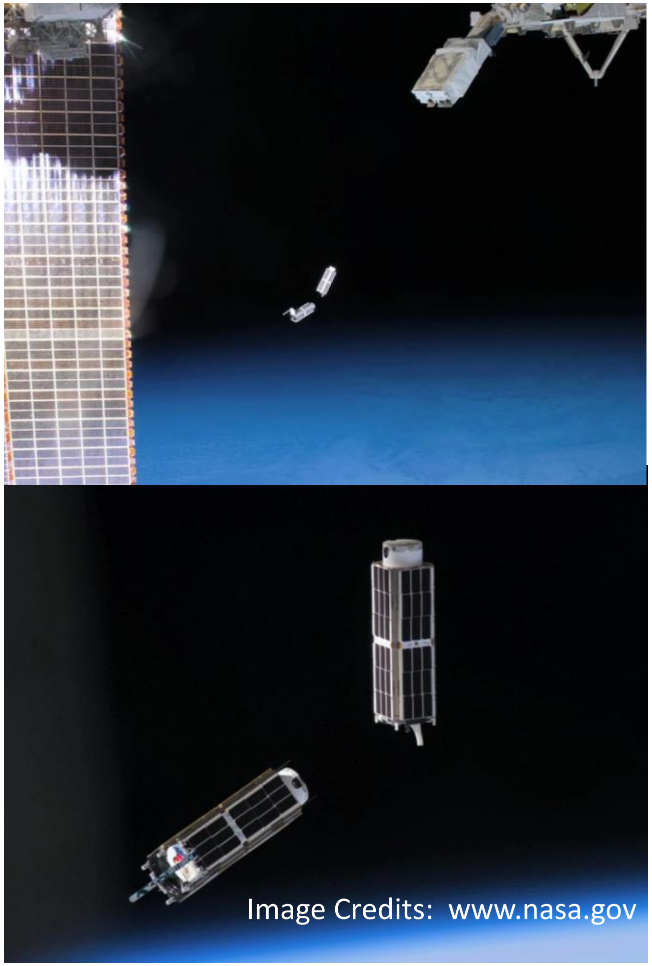
MISSE-6, March 2008-September 2009
Post Flight Analysis, near real time 18 months
Passive experiments

Shields-1: Materials Experiment Platform

CubeSat Market: $0.5B-1B over 3yrs

- Over 1700 small satellites forecasted for 2017-2023 (www.spaceworksforecast.com)
- Over 500 over next 3 yrs into polar low earth orbit (PLEO) (www.spaceworksforecast.com)
- Typical CubeSats costs $1-2M* (https://esto.nasa.gov/techval_space.html)

  **NASA ESTO Office reported it is $1-$1.5M per U at the 2017 SmallSat Conference and is updating its figure.*
- CubeSat value at risk: <u>$0.5-1B in the next three years alone</u>



LaRC Shields-1: materials experimental platform

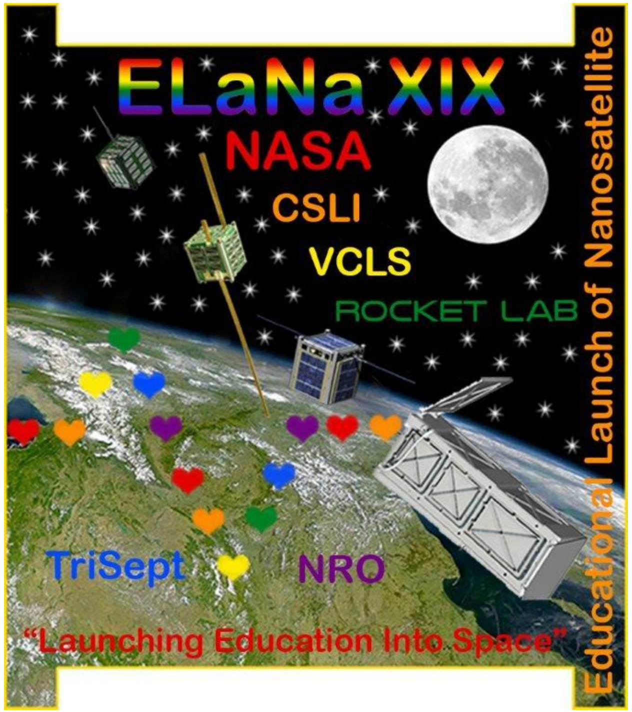
7 Kg, 10cm x 10cm x 33 cm
Near real time: 1 min data collections

Highlights

- Extends typical CubeSat missions from 3 months to years with an atomic number (Z)-grade vault.
- Demonstrates a Charge Dissipation Film designed for extreme charging environments.
- Develops and demonstrates a one-piece (Z)-grade radiation protection for electron radiation environments.
- Matures innovative μdosimeters.
- Reduces technology development schedule and associated costs by collective testing in a relevant space environment.

Shields-1 on ELaNaXIX Mission

- **Shields-1 owned by NASA Langley Research Center and Co-Operated by University of Michigan**
- **Sun-Synchronous Orbit 85 deg inclination and 500 km altitude**
- **Launch Date Aboard Rocket Lab USA, Electron Rocket December 2018**



Three Experiments

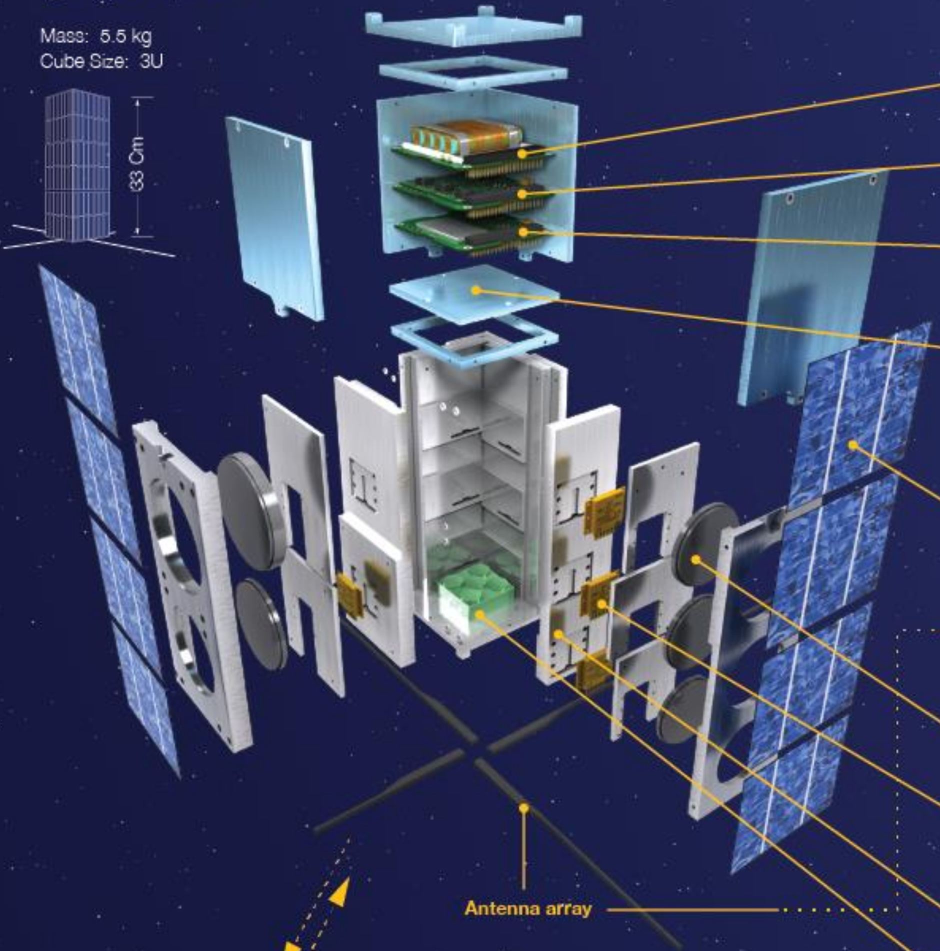
- **Atomic Number (Z)-Grade Radiation Shielding**
  - **To measure total ionizing dose of Z-grade radiation shielding and compare to baseline aluminum for at least 3 samples each.**
- **Charge Dissipation Film Resistance**
  - **To measure the resistance over time.**
- **Vault Electronics**
  - **To measure total ionizing dose (TID) over time and monitor system electronics performance.**

Spacecraft Overview with Experiments

Excerpt: Shields-1 Brochure, NASA NP-2015-04-608-LaRC

Shields-1

Mass: 5.5 kg
Cube Size: 3U



System

Low risk (green) / Med risk (yellow) / High risk (red)

CubeSat Vault Electronics (green)
TRL Advancement: 4-6, Partner: MXL, AstroDev
Redesigned board layout to fit in the inner CubeSat vault form factor.

Battery system (green)
Partners: MXL, AstroDev
Four lithium ion cells provide power during eclipse periods and high power operational modes. The batteries provide 6800 mAh at 8.4V.

Electrical power system (green)
Partners: MXL, AstroDev
The EPS regulates power from the solar panel and outputs three bus voltages: 3.3V, 5.0V, 8.4V. Telemetry systems monitor currents, voltages, and temperatures.

Flight computer and Communications (green)
Partner: AstroDev
The Flight Computer provides telemetry collection and command control capabilities. It interfaces to various sensors around the spacecraft, controls the payload, and logs data to dual, redundant SD card systems. A lithium-1 radio provides half duplex communication in the UHF band.

Z-Grade Radiation Shielding Vault (yellow)
TRL Advancement: 3-6, Partners: NASA Langley Research Center
Radiation shielding using Atomic Number (Z) Grade Technology for enhanced electron shielding performance with reduced volume benefits for small satellite applications.

Flight Software (green)
TRL Advancement: 7-9, Partners: MXL, AstroDev
The flight software, written in C, provides primary spacecraft operational capability and runs on the flight computer. It gathers telemetry, monitors health, and processes commands, both in real time from the ground and scheduled for a later time. The software has flown in various forms on RAX, MCubed, and GRIFEX.

Electrostatic Discharge Cleaned CubeSat Solar Panels (yellow)
TRL Advancement: 4-8, Partner: Vanguard Space Technologies, Inc. SBIR Commercial Readiness Program
CubeSat Solar Panels designed for extreme radiation environments.

Antenna array (green)
The ISIS deployable antenna system contains up to four tape spring antennas of up to 55 cm length. The system can accommodate up to four monopole antennas, which deploy from the system after orbit insertion. The antenna system has been designed for maximum compatibility with existing COTS CubeSat components.

Research

Work Research Payload (yellow)
Experimental Radiation Shielding: Experimental Z-grade or baseline shielding with varying areal densities in front of the μdosimeters.

μDosimeters (green)
TRL Level: 9
μdosimeters tested in inner and outer proton belts with varying shielding areal densities.
Space heritage from previous missions: AeroCube 6, MARS, Van Allen Probes, Rapid Pathfinder "Deal" Mission, LRO, MISSE-7B.

Back Shield Panels (yellow)
Shielding behind the μdosimeters to create a back slab. Most radiation will enter through the front Z-grade experimental sample or baseline shield.

Charge Dissipation Film (red) (schedule)
TRL Advancement: 3-6, Partner: LUNA Innovations, Inc.
LUNA XP-CD-B is a charge dissipation film designed for extreme internal charging environments, developed through the NASA STTR Phase I proposal award NNX11CI29P and Phase III.

Ground Systems

Proposed Ground link station (green)
Wallops Island
18 Meter UHF parabolic dish: 401 MHz U/L and 402 MHz D/L, Government Frequency License submitted in the first half of FY2014.

Mission Operations

Flight Mission Support Center (green)
NASA Langley Research Center
Special operations center for launch support, early orbit and payload activation, anomaly resolution, data capture and down link, payload health and monitoring.

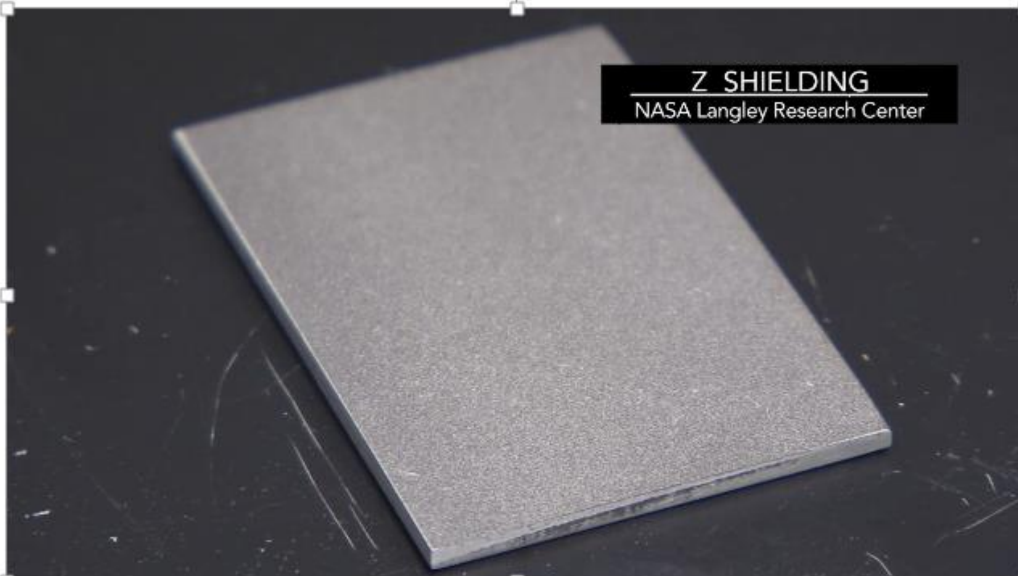
Shielding Experiment

LaRC Z-Shielding Increases CubeSat Mission Lifetimes



NASA Tech-Transfer web releases of LaRC Z-Shielding

Z-shielding Technology pitch:
https://www.youtube.com/watch?v=oHA8j5bpFcU&t=21s
Webinar: https://www.youtube.com/watch?v=RrqDocGqawQ
https://techgatewire.larc.nasa.gov/2017/01/26/radiation-protection-material-webinar/

- **Extends typical CubeSat missions from 3 months to years**
- **A 100x reduction of total ionizing dose and removal of internal charging effects.**
- **Increases return on investment**

Total Ionizing Dose (TID) Environment

Polar- LEO:

- **Orbit: 102° inclination, 775 km apogee, 458 km perigee**
- **ELaNa III[1] CubeSat environment: AUBIESAT-1, RAX-2, DICE, Explorer, M-Cubed/COVE.**
- **TID environment Shielddose-2 calculation[2]: 5.0 kRad/yr total dose, 0.5 g/cm2 Al**
  - *0.5 g/cm2 ~ 0.078 in Al the typical Al Structure thickness for the CubeSat standard form factor*
  - *Commercial parts Hardness levels[3]: 2-10 Krad*
  - *Radiation Design Margin[4] of 2*

Adding shielding to commercial CubeSats reduces risk for premature failures due to total ionizing dose

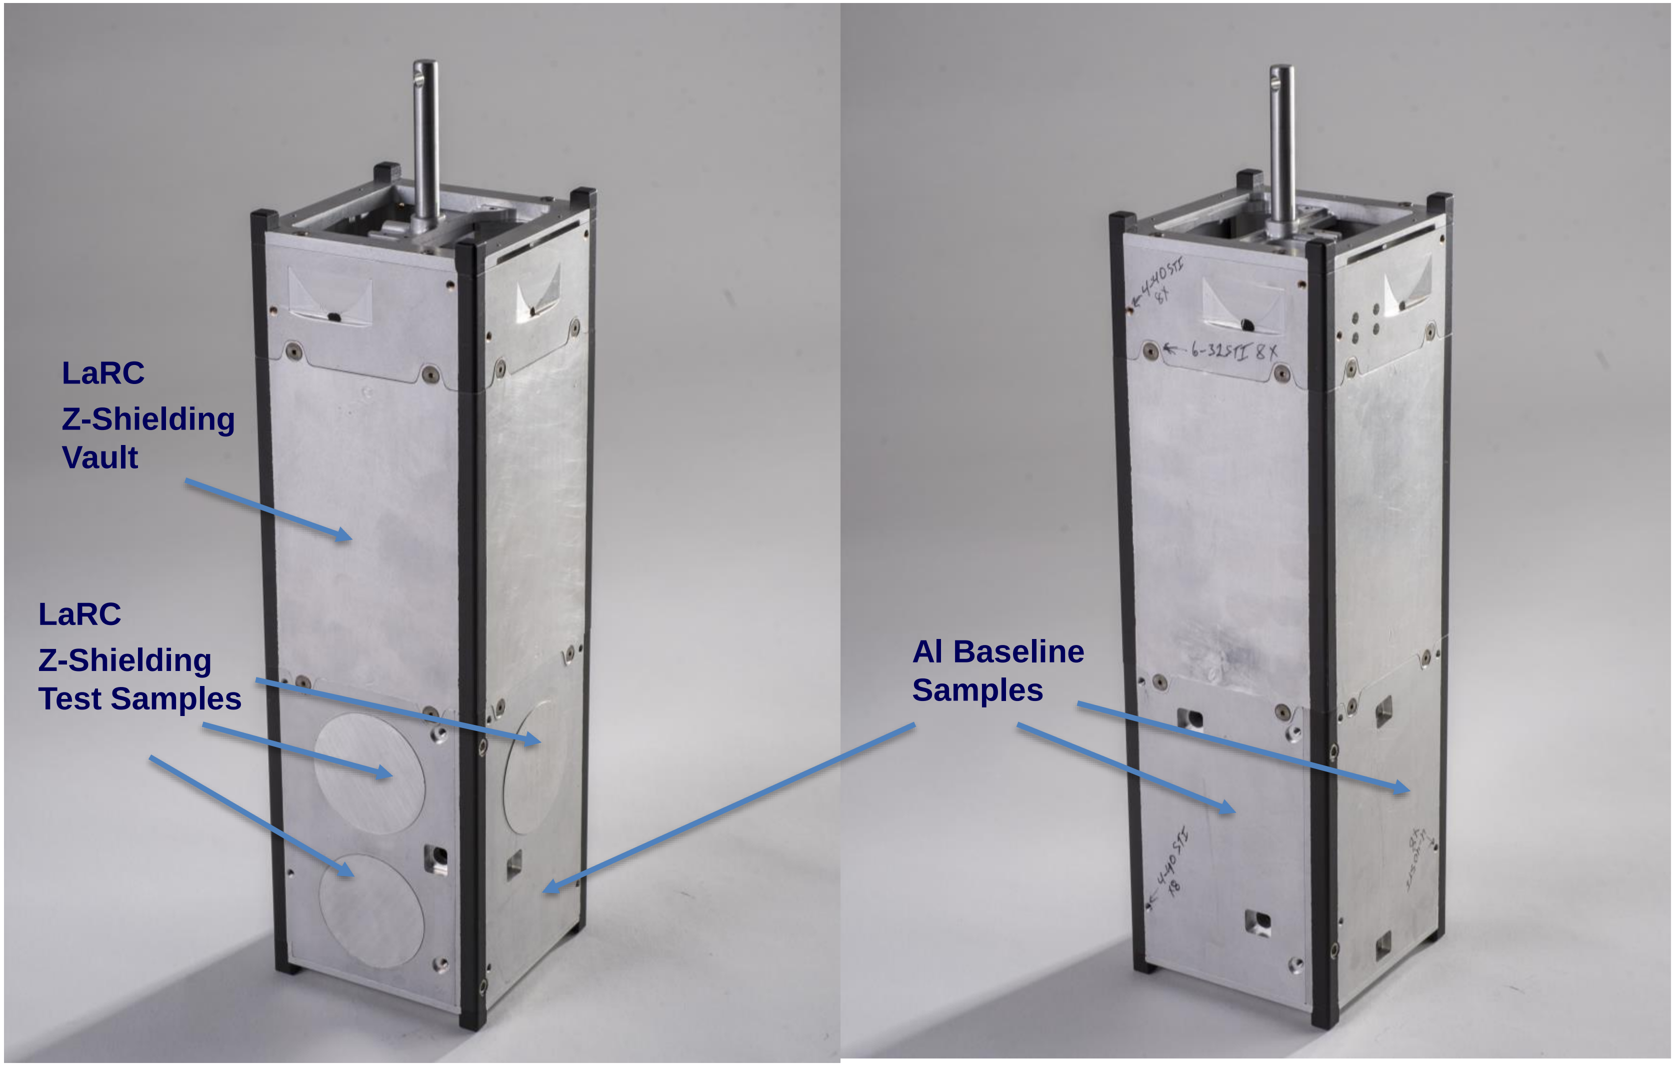
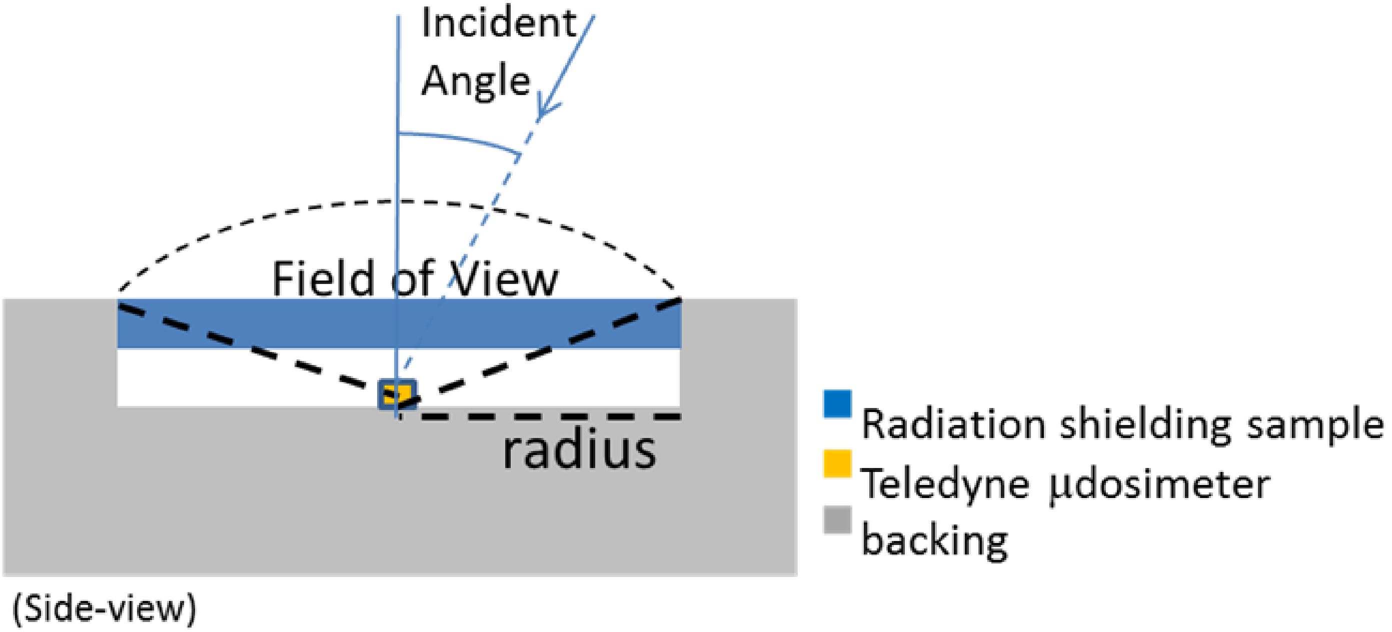
Shields-1: 2 Orientations



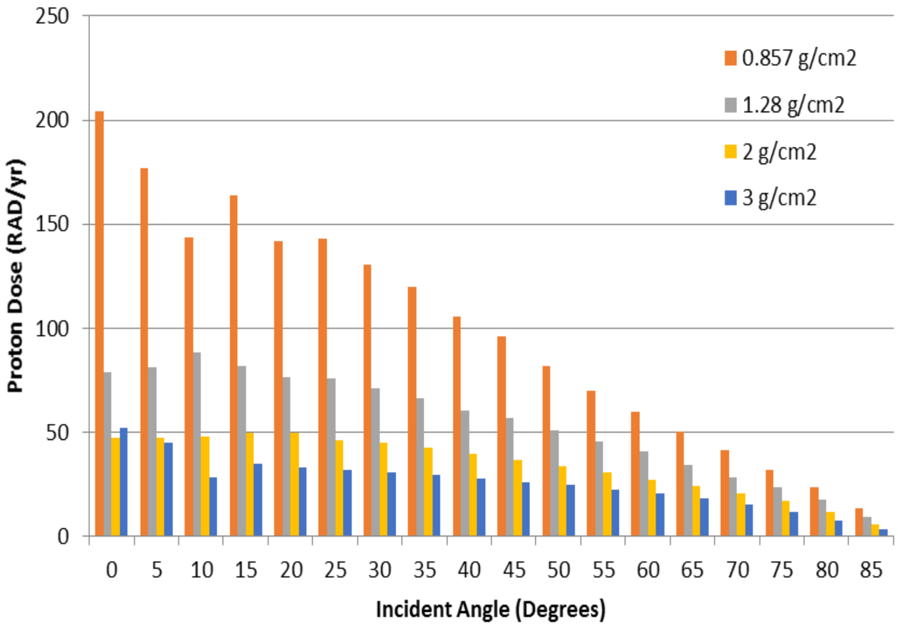
Radiation Shielding Experiment

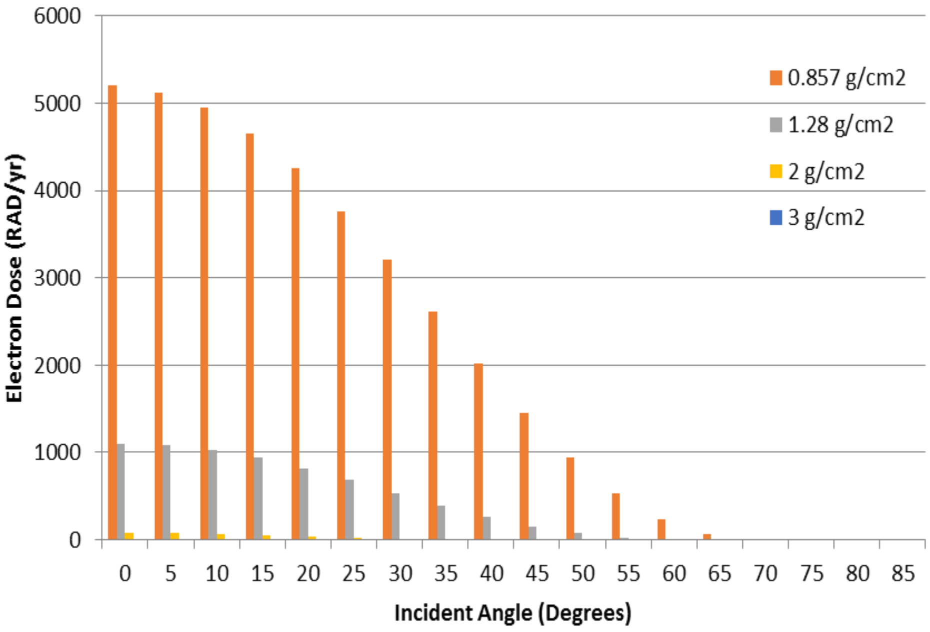


- Infinite slab, geometry approximation
- >95% incident radiation through shielding sample
- Large sample field of views, thick backing

Aluminum (Al) Incidence Angle Dependence on Total Ionizing Dose (TID)

SPENVIS: Shieldose-2 from AP8min-AP8Max Model Al half-sphere results with trigonometric determined incident angle dependencies of areal density in a slab geometry for GTO.

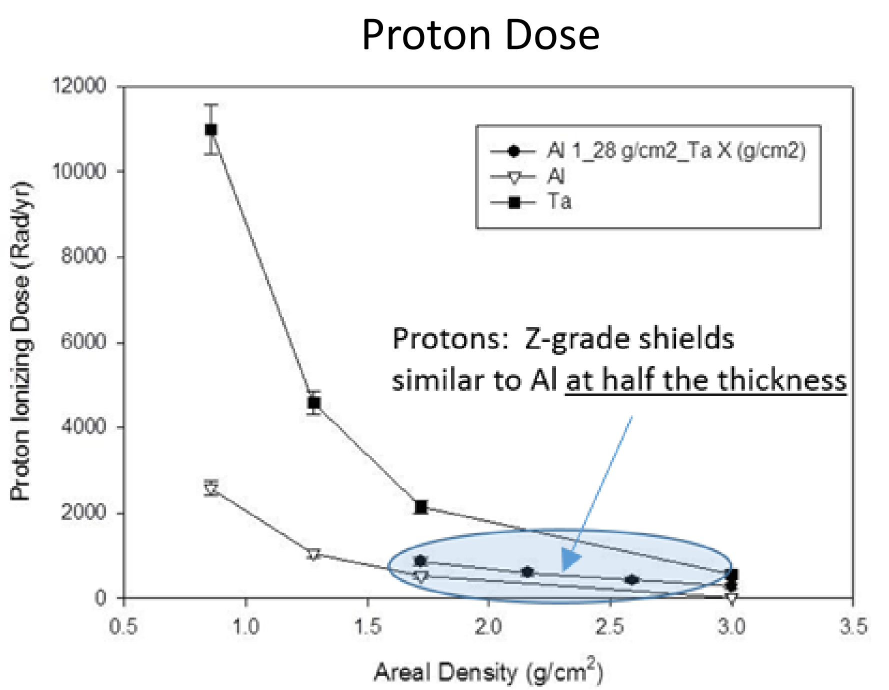


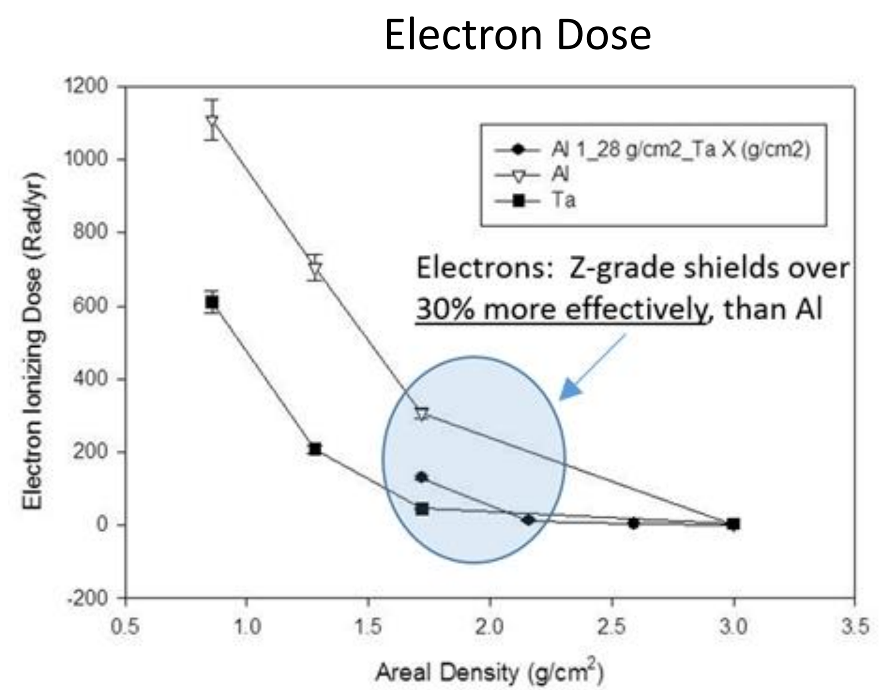


- Incident angle dependence used to determine shielding field of view slab diameters.
- In order to receive greater than 95% of the proton radiation through a shielding slab the incident angles need to be at least 75 degrees.
- No electrons contribute to dose from incident angles greater than 70 degrees.

Expected Dose Results for Various Shielding Areal Densities in GTO

SPENVIS: Ionizing dose from AP8min-AP8Max Model for GTO using MULASSIS with propagated integration error from the μdosimeter as a function of areal density.





Aluminum/ Tantalum Z-Grade Shielding Samples (Al_Ta)
Baseline: Aluminum (Al) and Tantalum (Ta)

Z-Grade Shielding Materials and Technology Development

Z-Grade Shielding from Titanium and Tantalum Diffusion Bonding

Shields-1: Astrodev vault electronics, flight stack spare

Conclusion

- Z-Grade Shielding offers reduction of total ionizing dose on sensitive electronics.
- Internal charging effects are greatly reduced.
- Extends typical CubeSat missions from 3 months to years
- Increases return on investment
