# Environmentally friendly polyurethane (PU) materials for space applications 

ESA-ESTEC

TOSEDA s.r.o.
Ariane Group GmbH
Latvian State Institute of Wood Chemistry

## Target

- Development of novel eco-friendly polyurethane materials avoiding use of toxic non-isocyanate based PU materials for versatile applicability in aerospace industry:
a/ potting systems (spacecrafts manufacturing),
b/ conformal coating (spacecrafts manufacturing), and
c/ thermal insulation foams (launchers manufacturing).

## Requirements

- Elimination of toxic isocyanates used in traditional production of PU materials
- Minimization of health and ecological risks
- Sustainability aspect - use of renewable resources
- No solvent content in the target product.
- EU market availability / ITAR free.
toreda

Previous activity:

- Development of (H)NIPU conformal coating, potting and rigid foam
- ESA program: TRP
- Duration: 2017-2019
- ESA Contract: 4000119685/17/NL/KML
- TRL:

3-4

TOSEDA s.r.o. (CZ)

- SME
- Prime-Contractor
- Design, formulation, preparation and testing of HNIPU materials

## CCN1:

## Latvian State Institute of Wood Chemistry (LV)

- Non-profit organization
- Sub-Contractor
- Semi scale of HNIPU foams by spraying and testing
- Extension towards applications as conformal coatings and as potting material
- Duration: 2020-2022
- TRL: 4-5
„Development of „Green" Polyurethane Materials for Use in Spacecraft and Launcher Applications"

## Approach

Non-isocyanate polyurethane synthesis

European Space Agency arianegroup

## Synthesis of cyclocarbonates

- Starting raw materials: epoxy compounds based on renewables
- Pressure: 40 bars $\left(\mathrm{CO}_{2}\right.$ inlet)
- Temperature: $110^{\circ} \mathrm{C}$ (inside of the reactor)
- Mixing: mechanic stirrer
- Capacity: 500 mL
- Catalyst: Quaternary ammonium salt
- Reaction time: ca 10-72 h (epoxy groups content $\leq 0.05 \mathrm{~mol} / \mathrm{kg}$ )

TOSEDA's laboratory pressure reactor set-up.

European Space Agency $\qquad$

## Synthesis of cyclocarbonates

| Cyclocarbonate | Viscosity @ $25^{\circ} \mathrm{C}$ [Pa.s] |  | Epoxy group content [mol/kg] |  | Theoretical |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | before | after | before | after | conversion <br> $[\%]$ |
|  | cyclocarbonation |  |  |  |  |

*Benchmark targets

European Space Agency

## HNIPU rigid thermoinsulation foams

- Best candidate HNIPU foam
- Non-isocyanates urethane bonds $=37,6 \%$
- Renewables $=48,2$ \%
- Density $0.075 \mathrm{~g} / \mathrm{cm}^{3}$
- CF free blowing agent

- Mixing ratio $A / B=1 / 1$
- Applicable by spraying

- White color
- Fine cell structure
- No shrinkage
- A $=0.67$ Pa.s $\left(25^{\circ} \mathrm{C}\right)$
- $\mathrm{B}=0.86$ Pa.s $\left(80^{\circ} \mathrm{C}\right)$

## Conclusions - previous study

- Hybrid non-isocyanates polyurethanes as new environmentally friendlier alternative to traditional PU materials
> Up to $100 \%$ replacement of toxic isocyanate hardeners
> Up to ca $60 \%$ renewable raw materials

| SYSTEM | Hydroxy urethane bond mass per total bond mass <br> [wt. \%] | Content of renewables based components <br> [wt. \%] |
| :--- | :---: | :---: |
| NIPU potting | 100 | 58 |
| HNIPU conformal coating | 43 | 51 |
| HNIPU foams | 38 | 48 |

- The pre-developer HNIPU rigid foam has high potential to be implemented as external thermal insulation on existing and future Launch Vehicles by spraying without use of hazardous blowing agents
- The pre-developed (H)NIPU resins are suitable candidates for application in space vehicles electronics such as potting and conformal coating materials
- Next steps: to increase maturity to TRL 5
arıanegroup

## CCN1

## Studied systems:

- Conformally coated printed circuit boards
- 2 component system
- 1 component system - UV curable (back-up system)
- Pressure sensors encapsulated by potting system

Target:

- Adjustment of key parameters - rheology, curing conditions, Tg, tensile properties, thermal conductivity, and electrical resistance according to the selected target applications.
- TRL: 4-5

## The optimization:

- Verification of reproducibility of cyclocarbonates synthesis
- Optimization of formulations of the predeveloped (H)HNIPU systems
torede

## Synthesis of cyclocarbonates - optimization

- Synthesis
> Newly 4 types of cyclocarbonates (3 derivatives of renewables)
- Catalysts concentration
> The most optimal $\operatorname{TBABr}$ catalyst concentration is $0.5-1.0 \mathrm{wt}$. \% when the constant conversion $\geq 99 \%$ is reached after ca 6 h .
> Chemical structure confirmed by NMR.
- Catalysts regeneration
> Possible by extraction, however with limited purity and yield.
> Recycling extra technological step requiring solvents waste management - economically/ecologically ineffective.
- Synthesis reproducibility - scale up
> Semi scale lab pressure reactor - 300 g of cyclocarbonate per batch with conversion over $99 \%$.
> However, increase batch volume from 100 to 300 g reflected in $3 x$ increase of the synthesis time.

## ESA Contract No. 4000119685/17/NL/KML

"Development of „Green" Polyurethane Materials for Use in Spacecraft and Launcher Applications"

European Space Agency

## Conformal coatings - updated requirements

- Outgassing (required as per ECSS-Q-ST-70-02C: RML $<1.0 \%$, CVCM $<0.1 \%$ ).
- Viscosity $\leq 8$ Pa.s. at RT.
- Working time: 60-90 min (Pot life min 1 h ).
- Curing time $\leq 7$ days @ RT (preferably $\leq 24 \mathrm{~h} @ 60^{\circ} \mathrm{C}$ ) for two components system and preferably less than 1 hour @ RT for one component system.
- Operation temperature preferably $-60^{\circ} \mathrm{C}$ to $120^{\circ} \mathrm{C}$.
- Glass transition temperature $\leq 1^{\circ} \mathrm{C}$.
- Surface hardness $\geq 70$ Shore A.
- Volume resistivity $\geq 5,7 \times 10^{11} \Omega$.m.
- Tensile strength $\geq 2,5 \mathrm{MPa}$ at RT and $\geq 45 \mathrm{MPa}$ at $-60^{\circ} \mathrm{C}$.
- Elongation at break $\geq 90 \%$ at RT and $\geq 20 \%$ at $-60^{\circ} \mathrm{C}$.
- Resistance to common cleaning agents, such as isopropyl alcohol.
- Film quality inspection: Coating thickness and Uniformity of coating on selected surfaces.
- Ease of repair (e.g. by mechanical stripping).
- Linear thermal expansion coefficient (CTE) $<2 \times 10^{-4} 1 /{ }^{\circ} \mathrm{C}$.
- Thermal conductivity $\geq 0.35 \mathrm{~W} / \mathrm{m}$.K.
- Thermal cycling ( 10 cycles between LN 2 and $+120^{\circ} \mathrm{C}$ at atm. pressure).
- Pull of strength before $\mathrm{TC} \geq 3 \mathrm{MPa}$ (Al substrate) and after TC $\geq 2.65 \mathrm{MPa}$ (Al substrate).
- High temperature moisture absorption $\leq 3 \%$.
- Resistance to common cleaning agent such as isopropylalcohol.

„Development of „Green" Polyurethane Materials for Use in Spacecraft and Launcher Applications"

European Space Agency

## Potting system - updated requirements

- Outgassing (required as per ECSS-Q-ST-70-02C: RML < 1.0\%, CVCM < 0.1\%).
- Viscosity $\leq 10$ Pa.s.
- Working time at RT: 1-3 h (Pot life min 1 h ).
- Curing time $\leq 7$ days @ $25^{\circ} \mathrm{C}$ (preferably $\leq 24 \mathrm{~h} @ 60^{\circ} \mathrm{C}$.
- Operational temperature $-20^{\circ} \mathrm{C}$ to $+80^{\circ} \mathrm{C}$ (preferably $-60^{\circ} \mathrm{C}$ to $+120^{\circ} \mathrm{C}$ ).
- Glass transition temperature $\leq 50^{\circ} \mathrm{C}$.
- Surface hardness $\geq 70$ Shore D.
- Volume resistivity $\geq 1$ G $\Omega$.m.
- Temperature range min from - $20^{\circ} \mathrm{C}$ to $80^{\circ} \mathrm{C}$, preferably from $-40^{\circ} \mathrm{C}$ to $120^{\circ} \mathrm{C}$.
- Tensile strength $\geq 5 \mathrm{MPa} @ 80^{\circ} \mathrm{C}$.
- Tensile strength $\geq 7 \mathrm{MPa}$ @ RT.
- Elongation at break $\geq 8 \%$ @ RT.
- Elongation at break $\geq 3 \% @-20^{\circ} \mathrm{C}$.
- Linear thermal expansion coefficient (CTE) $<2 \times 10^{-4} 1 /{ }^{\circ} \mathrm{C}$.
- Thermal conductivity $\geq 0.35 \mathrm{~W} /(\mathrm{K} . \mathrm{m})$.
- Thermal cycling (10 cycles between LN2 and $+120^{\circ} \mathrm{C}$ at atm. pressure).
- Pull of strength before thermal cycling $\geq 3 \mathrm{MPa}$ (Al substrate) and after thermal cycling $\geq 2.65 \mathrm{MPa}$ (AI substrate).
- High temperature moisture absorption $\leq 3 \%$.

European Space Agency

## Conformal coatings - optimization

- Optimization of the formulation composition
- Modification by selected nanoadditives
- Viscosity reduction by reactive solvents

| Sample ID | Tg <br> $\left[{ }^{\circ} \mathrm{C}\right]$ | Surface <br> hardness <br> [Shore A] | Thermal <br> conductivity <br> [W/m.K] | Volume <br> resistivity <br> $[\Omega . \mathrm{m}]$ | Tensile <br> strength at <br> RT <br> $[\mathrm{MPa}]$ | Elongation at <br> break at RT <br> $[\%]$ | Hydroxy <br> urethane bond <br> mass per total <br> bond mass <br> [\%] | Content of <br> renewable <br> based <br> components <br> [wt. \%] |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Conclusions - CCN1

- Optimization of cyclocarbonation
$>$ Synthesis of 4 types of cyclocarbonates (catalyst content optimized to 0,5 wt. \%)
> Scale-up (300 g batch) and reproducibility - successful
$>$ Recycling of catalyst - economically and ecologically ineffective
- Optimization of formulations of the predeveloped NIPU conformal coating and potting materials according to the selected target industrial application (TRL 4).
> In progress
- Validation of industrial applicability - testing of breadboard demonstrator (pressure sensor) in a collaboration of the industrial partner (TRL 5).
> Next steps
