Established in:  
**2016**

Number of employees:  
**28**

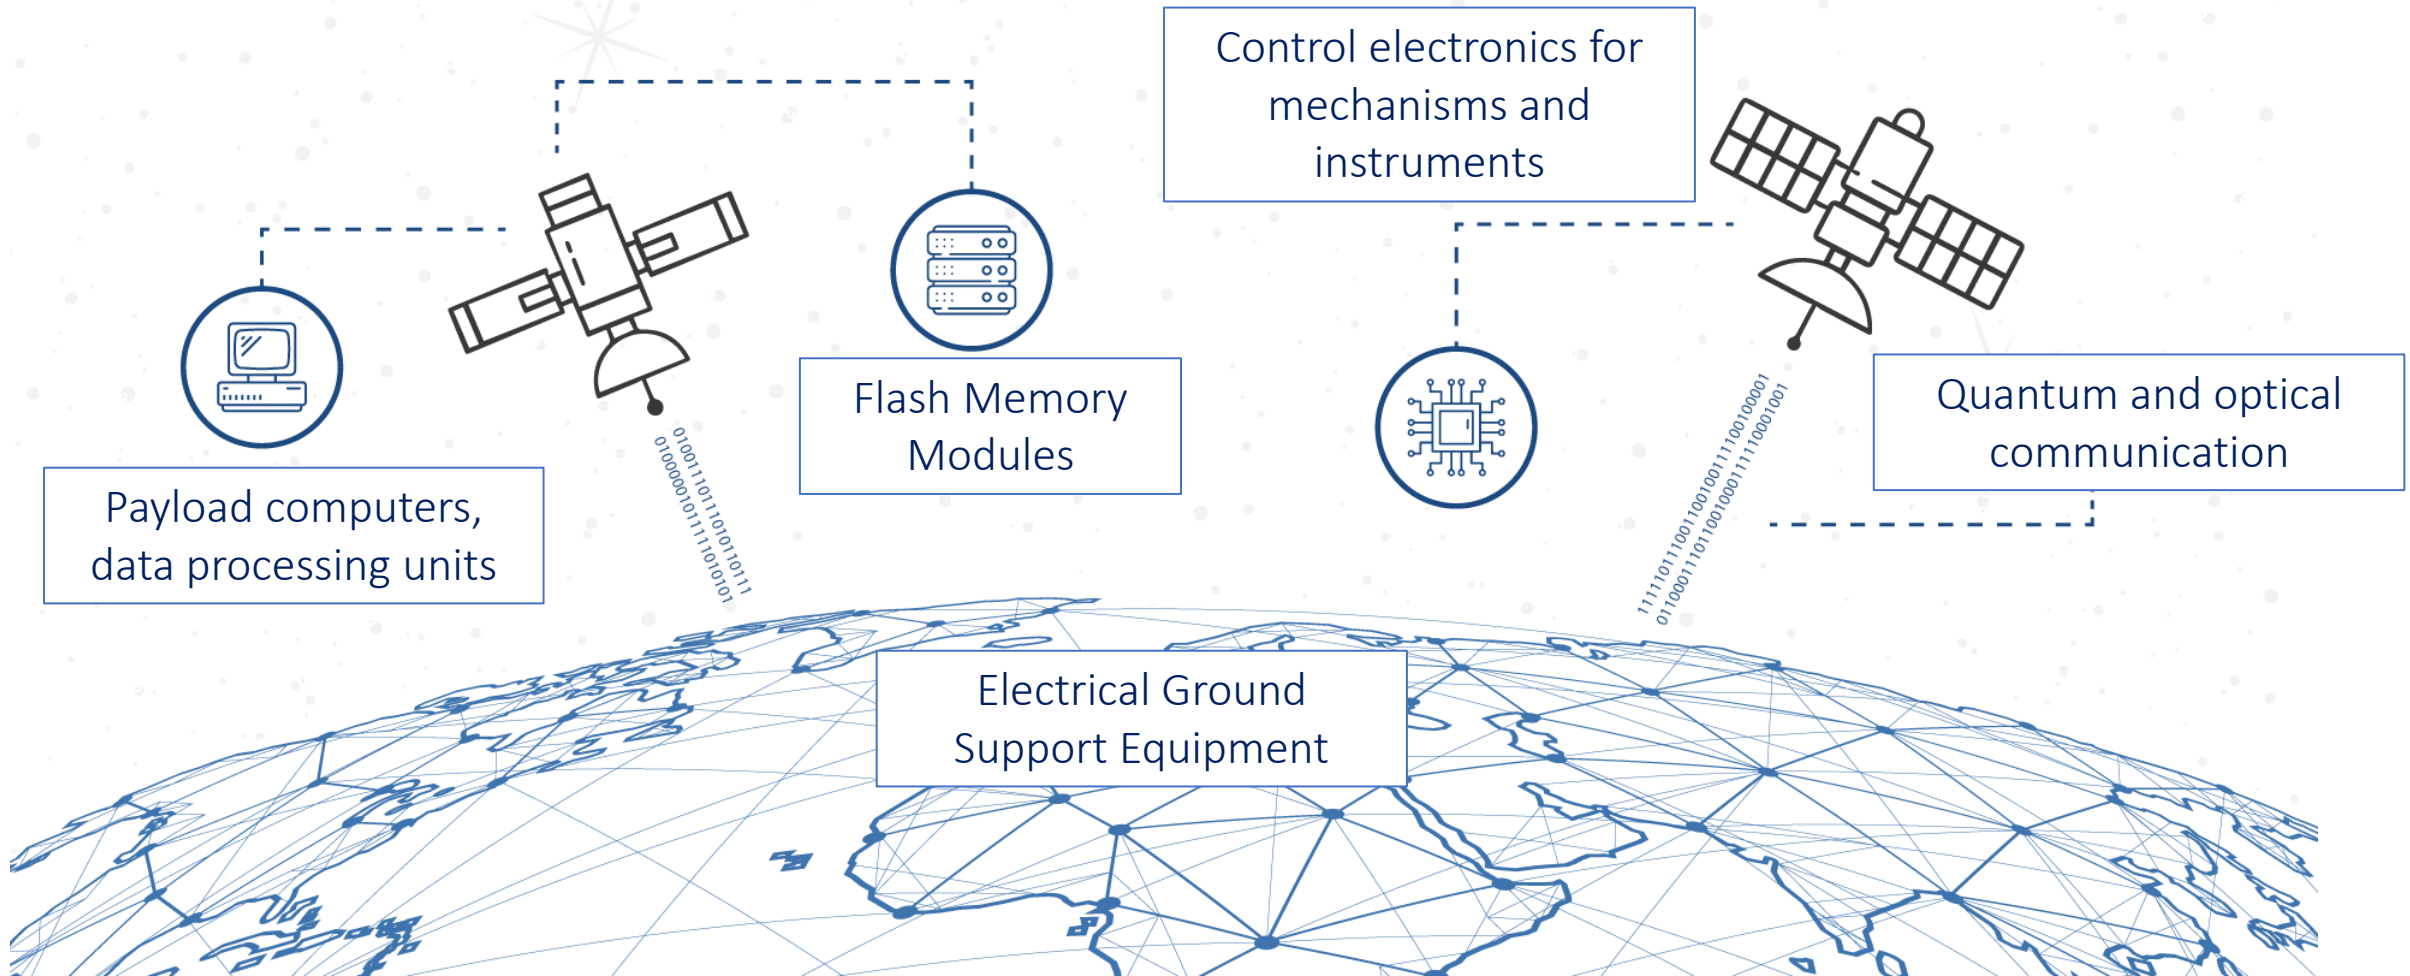

Headquarters:  
**Gdańsk, Poland**

Gdańsk Science and Technology Park - headquarters

# Areas of expertise

# Project's objectives

Developed in the scope of the Polish Industry Incentive Scheme (PLIIS) as „Demonstration of SpaceFibre Technology Usage for Image Processing Applications” (SFIC).

## Goals:

- Demonstration of parallel operation of CCSDS-121 and CCSDS-123 compatible multispectral image compression IP cores on a high-performance FPGA evaluation board.
- Demonstration of combined CCSDS-123 and CCSDS 121 IP cores (SHyLoC IP core), thus serving as a baseline for future developments in this technological area.
- Show the SpaceFibre interface as a high-throughput data transfer interface used to transmit hyperspectral images to the compression cores to realise on-the-fly image compression.

# Project's origin

- Continuation of work presented by the team from ULPGC on previous SEFUW in 2018.
- Usage of CCSDS-123 and CCSDS-121 IP cores designed by the team from the same University.

Review and comparison of design methodologies and hardware implementations on FPGA technologies.  
Case study: CCSDS compression algorithms for multispectral and hyperspectral images

Yúbal Barrios, Antonio Sánchez

SEFUW 2018

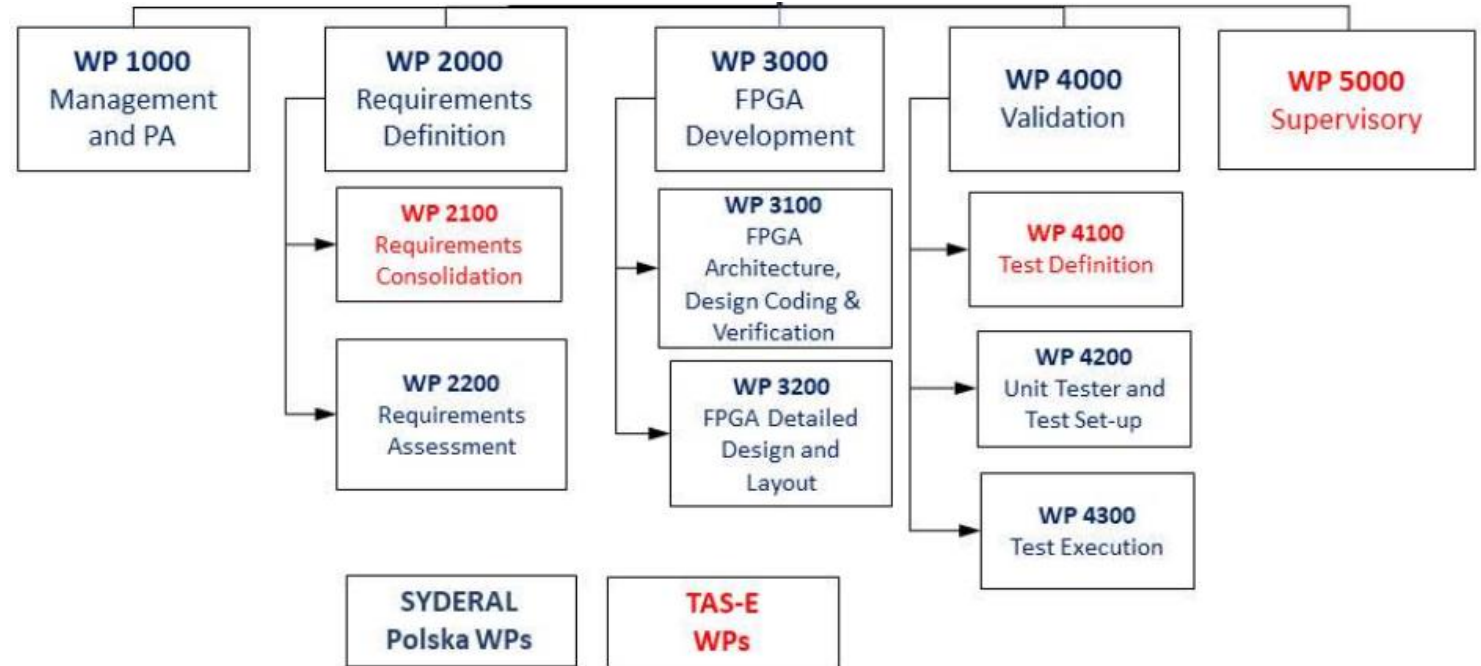

# Workplan

Project duration :  
17.07.2019 - 11.05.2021

Consortium consists of:

Syderal Polska, Poland – main contractor

Thales Alenia Space – España, Spain  
- subcontractor

# Outline

- Introduction and objectives
- **Requirements**
- Design description
- Design verification in simulation
- Design validation in hardware
- Summary

# Requirements overview

© Techwell

- The requirements for this project have been prepared by TAS-E engineering team, having large experience in on-board data processing projects, as well as image compression.
- The set of requirements was also in line with the ones that ESA is requiring for future architectures in their ITTs.

# Requirements - interfaces

- Receive hyperspectral images to be compressed through **SpaceFibre interface (2.5 Gbps)**.
- Send back compressed image through **SpaceFibre interface**.
- Images in Band Interleaved by Pixel format (BIP).
- Use different SpaceFibre virtual channels for both compression cores (VC1 and VC2).
- Allow configuration of compression IP cores through **SpaceWire RMAP (100 Mbps) or SpaceFibre VC0 interface (with RMAP protocol)**.
- Allow debugging through UART interface.

# Requirements - compression cores

- Compress the images with one of two compression cores:
  - **Compression Core 1**  
Configured to perform the function of both CCSDS-123 (preprocessor) and CCSDS-121 (block adaptive encoding) – creating SHyLoC. Runtime configurable. Initial configuration for AVIRIS dataset.
  - **Compression Core 2**  
Configured to perform the function of CCSDS-123 (pre-processor + sample-adaptive encoding). Pre-configured for LANDSAT dataset.
- Allow simultaneous online compression using both compression cores.

# Requirements - compression modes

## Online mode (on-the-fly)

Image data received through the SpFi interface, **compressed data is send back on the same SpFi virtual channel.**

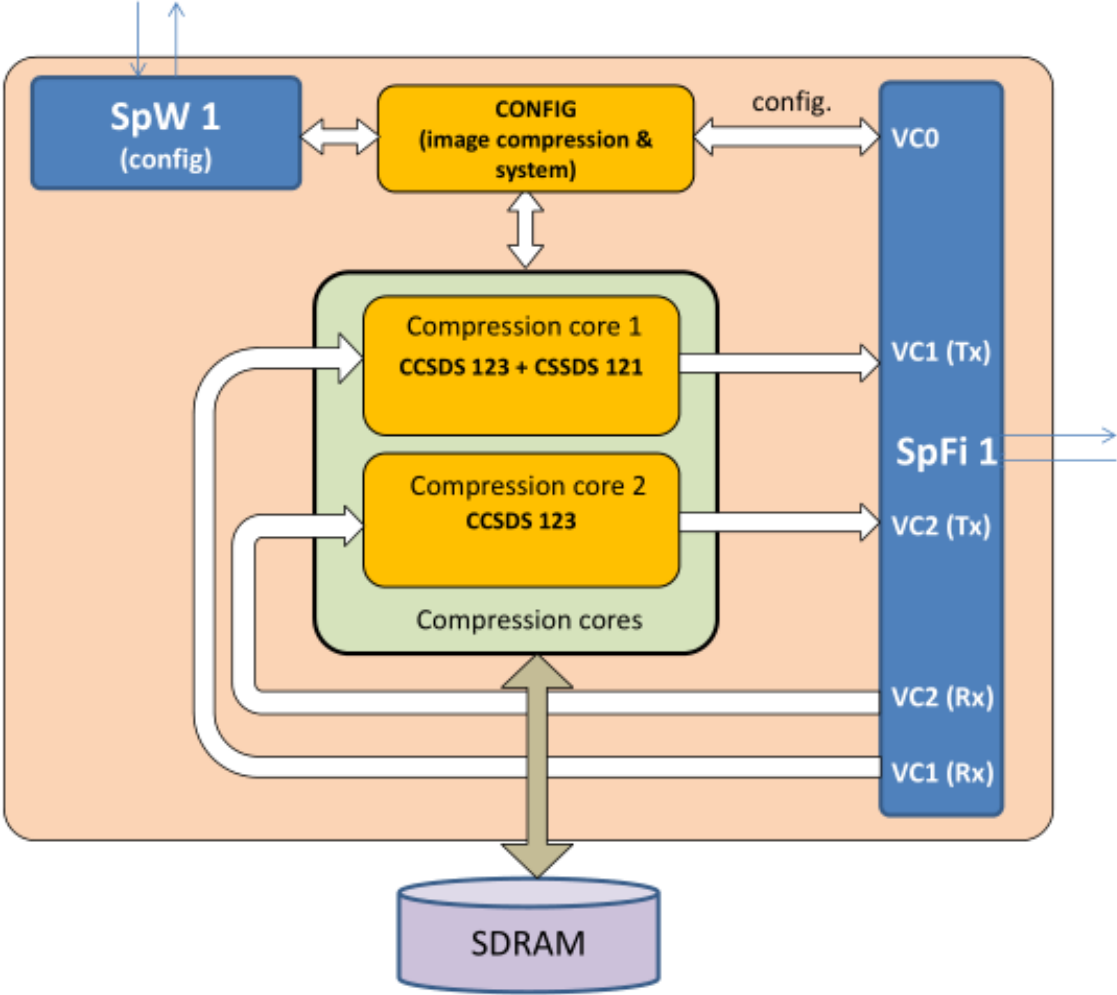

## Offline mode

Image for compression is stored in **external DDR memory** first. On request, this image is being transfered to the selected compression core and the resulting compressed image is **stored back in the DDR memory.** It can be later retrieved with SpW or SpFi VCO (RMAP).

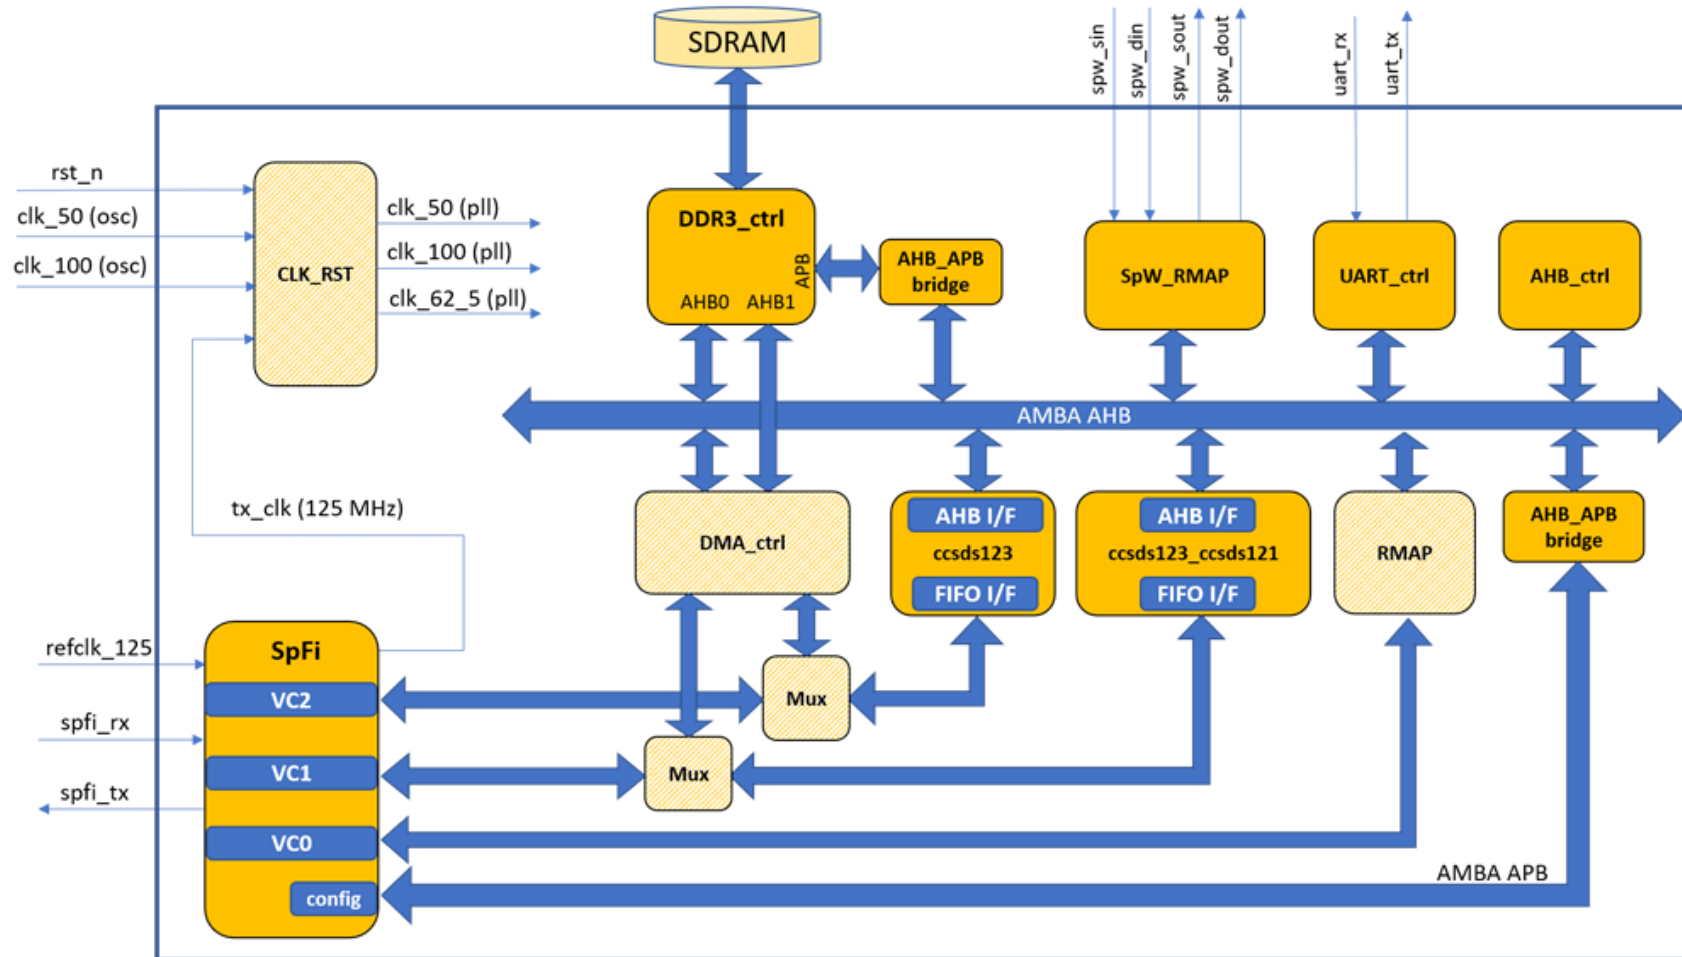

# Outline

- Introduction and objectives
- Requirements
- **Design description**
- Design verification in simulation
- Design validation in hardware
- Summary

# General architecture

# FPGA architecture

# FPGA modules development/reuse

Module	Generated with Microsemi Libero SoC	External IP core	Fully developed in-house
CLK_RST	X		
DDR3_ctrl	X		
UART_ctrl	X		
AHB_ctrl	X		
AHB_APB bridge	X		
SpFi		X	
SpW RMAP		X	
ccsds123		X	
ccsds123_ccsds121		X	
RMAP			X
DMA_ctrl			X

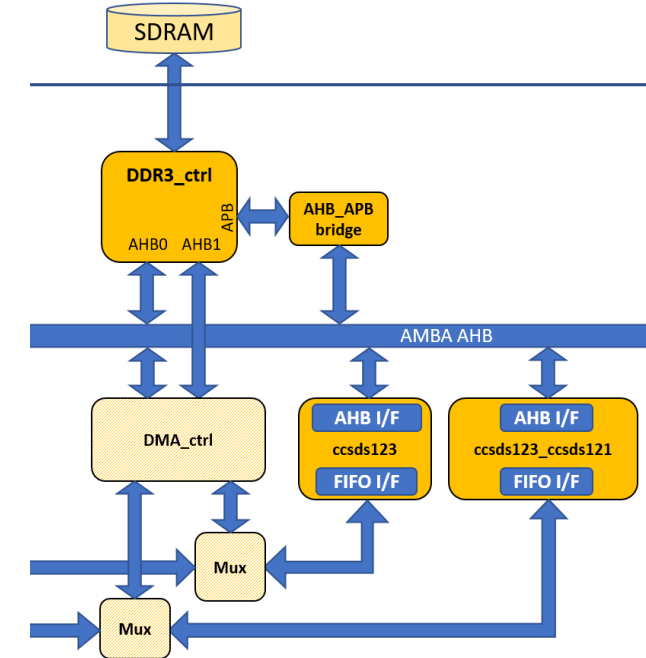

# DMA\_ctrl

DMA controller manages offline compression.

Responsible for:

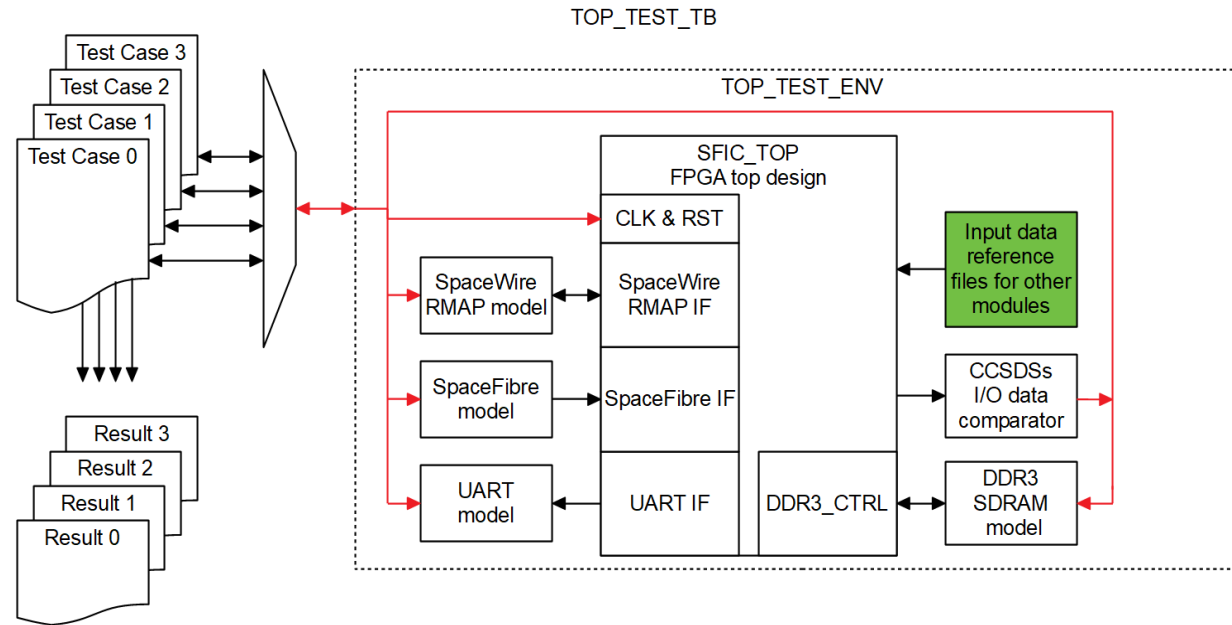

- Reading image data from SDRAM and providing this data to the appropriate compression core.
- Reading compression output from the compression core and saving this data in SDRAM for future readout.

# Outline

- Introduction and objectives
- Requirements
- Design description
- **Design verification in simulation**
- Design validation in hardware
- Conclusions

# Verification environment

## Verification environment:

- Top of representative FPGA used for hardware validation.
- Environment composed by FPGA interface models as well as both CCSDS blocks input/output data comparator with written/read data via SpaceWire/SpaceFibre IF.
- All Test Cases, defined in the FPGA Verification Plan, used to verify the FPGA compliance to the FPGA specification.

# Compression parameters for simulation

No.	Parameter	Core		
		CCSDS123	Embedded CCSDS123	Embedded CCSDS121
<b>Predictor constants</b>				
1	Number of bands used for prediction <b>P</b>	3	3	3
2	Prediction mode	full	full	full
3	Local sum type	neighbour oriented	neighbour oriented	neighbour oriented
4	Weight component resolution <b>Omega</b>	10	10	10
5	Register size <b>R</b>	32	32	32
6	Weight update scaling exponent final parameter <b>v_max</b>	3	3	3
7	Weight update scaling exponent initial parameter <b>v_min</b>	-1	-1	-1
8	Weight update factor change interval <b>t_inc</b>	4	4	4
9	Weight initialization mode	default	default	default
<b>Sample-adaptive encoder constants</b>				
10	Initial count exponent <b>gamma_0</b>	1	1	1
11	Accumulator initialization type	constants	constants	constants
12	Accumulator initialization constant <b>k</b>	3	3	3
13	Rescaling counter size <b>gamma*</b>	6	6	6
14	Unary length limit <b>Umax</b>	16	16	16
<b>Block-adaptive encoder constants</b>				
15	Block size <b>J</b>	-	-	16
16	Reference sample interval <b>r</b>	-	-	32
17	Code option	-	-	basic

# Reference file generation

- Image files for simulation prepared with a Python script – all files containing samples with incremental values, starting from 0x00.
- Compressed reference files prepared with the Compressor tool distributed as a part of the WhiteDwarf Data Compression Evaluation Tool available at ESA website.
- Compressed output generated by compression cores is compared with prepared reference files at the end of the simulation.

# Verification results

Passed.

- Summary

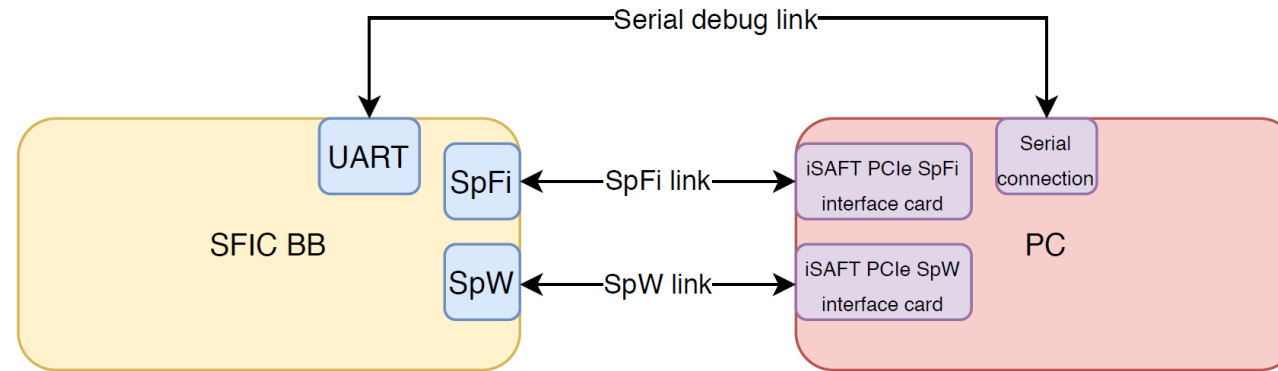

# General HW test setup #1

The Breadboard Model of the SFIC (SFIC BB) consists of:

- Microsemi RTG4 development kit,
- FMC SpaceWire/SpaceFibre Board from STAR-Dundee.

# General HW test setup #2

The test-PC incorporates 2 PCIe boards offering SpaceWire and SpaceFibre interfaces:

- STAR-Dundee SpaceWire PCI Express
- Teletel iSAFT Quad SpaceFibre PCIe

# Actual view from the lab

# Software used

Ball Aerospace COSMOS software suite can be used to control a set of embedded systems. These systems can be anything from test equipment to development boards and satellites.

In SFIC, it has been used on the test PC to orchestrate overall tests execution by controlling all used communication interfaces.

# Software used

The image displays two software windows: 'COSMOS Command and Telemetry Server' and 'Test Runner'.

**COSMOS Command and Telemetry Server:**

- Interfaces Table:**

Interface	Connect/Disconnect	Connected?	Clients	Tx Q Size	Rx Q Size	Bytes Tx	Bytes Rx	Cmd Pkts	Tlm Pkts	View Raw
BOARD_PWR_INT	Disconnect	true	0	0	0	40	25	10	5	View Raw
SPW_RMAP_INT	Disconnect	true	0	0	0	480	484	0	20	View Raw
SPFI_VC_0_RMAP_INT	Disconnect	true	0	0	0	69	59	0	4	View Raw
SPFI_VC_1_INT	Disconnect	true	0	0	0	0	0	0	0	View Raw
SPFI_VC_2_INT	Disconnect	true	0	0	0	18874368	8499420	0	161	View Raw
UART_INT	Disconnect	true	0	0	0	0	8	0	2	View Raw
- Telemetry Log:** Shows INFO and WARN messages for commands like 'BOARD\_PWR\_REQ\_TM\_POWER\_ON\_OFF' and 'BOARD\_PWR\_TM\_POWER\_ON\_OFF STATUS = OFF is YELLOW'.
- Command Sender:** Target: SPW\_RMAP, Command: REQ\_TM\_FPGA\_VERSION.
- Packet Viewer:** Shows formatted telemetry with units for 'TM\_READ\_SINGLE\_REG'.
 

Item	Value

# Performance results

Each compression core throughput has been calculated by dividing amount of transmitted data by the core compression time measured inside the FPGA.

**Core frequency: 50 MHz**

**AHB frequency: 50 MHz**

Maximum throughput reached for compression core 1 (SHyLoC) **~763 Mbps (~0.745 Gbps)**

<b>Parameter</b>	<b>Core 1 [Mbps]</b>	<b>Core 2 [Mbps]</b>
Online mode core throughput	<b>762.809</b>	228.881
Offline mode core throughput	186.440	173.966

# Summary

- SYDERAL Polska presented a demonstrator of SpaceFibre technology usage for image processing applications on the high-performance RTG4 FPGA based development board.
- CCSDS-123 and CCSDS-121 IP cores were used both as a standalone modules and together as SHyLoC.
- AVIRIS and LANDSAT dataset images compression was performed both in online and offline modes.
- SHyLoC (Compression core 1) parameters were possible to be updated in run-time.
- It was possible to use both compression cores simultaneously.
- Throughput of  $\sim 763$  Mbps using SpaceFibre interface has been achieved for SHyLoC.

Thank you for your attention!
