Agenda

- **LCA data collection approaches in different ongoing projects**
- **LCI improvement possibilities and outlook**

LCA Data Collection Approaches

LCA Data collection approach

- *Prime*

All LCI collection approaches have in common the compilation of “Primes Input to LCA”.

- Collects all LCI Data linked to the Prime (Work hours, Travels, Transport, Environmental testing at satellite level, including cleanroom)
- Provides the Satellite Level Context (Project Phases, Product Tree, ...) enabling the LCA Team to aggregate the the data collected in a meaningful way
- Bridges the Gap between the LCA Experts and the Satellite Experts coming from the Satellite Side

AIRBUS Primes Input to LCA

TABLE OF CONTENTS

1	Introduction	5
2	Documents	6
2.1	Applicable Documents	6
2.2	Reference Documents	6
3	Programmatic Overview	7
3.1	Main Entities involved in CRISTAL and LSTM	7
3.2	Model Philosophy	8
3.2.1	CRISTAL Models	8
3.2.2	LSTM Models.....	8
3.3	Sequence of Activities and Transports	10
3.4	Satellite Overview	12
3.4.1	CRISTAL Layout.....	12
3.4.2	CRISTAL Satellite Decomposition and Mass Budget.....	13
3.4.3	CRISTAL GSE.....	17
3.4.4	CRISTAL Environmental Test Campaign	19
3.4.5	LSTM Layout	23
3.4.6	LSTM Decomposition	25
3.4.7	LSTM Mass Budget	26
3.4.8	LSTM GSE.....	27
3.4.9	LSTM Environmental Test Campaign	29
3.5	Platform Equipment Commonality between CRISTAL and LSTM	31
3.6	Supplementary Information for Energy Consumption In Equipment Production.....	31
4	Prime Contractors LCA Data	35
4.1	CRISTAL Team Deployment.....	35
4.1.1	ESA Working hours and Travels	35
4.1.2	Subcontractor Working Hours and Travels	35
4.1.3	Prime Team and Astrobus Team.....	35
4.2	CRISTAL Cleanroom usage.....	37
4.3	CRISTAL Transports	40
4.4	LSTM Team Deployment.....	41

LCA Data collection approaches

Equipment - ESA Space system LCA guidelines

“Specific space LCI data-sets can be found in the annexes, from section 10.1 to 10.28 or in a database developed by ESA (RD [14]). **In case a required LCI is not available or representative and a new up-to-date version has to be developed**, the following actions are carried out:

Regarding equipment or materials:

- 1. Develop a specific LCI that is representative of the equipment or material that is included in the spacecraft(s), using the rules presented in this handbook in section 7.3 (preferred option);
- 2. Use a proxy, i.e. an LCI that is representative of a similar equipment or material.

Regarding instrument:

- 1. Develop a specific LCI that is representative of the instrument that is included in the spacecraft, using the rules presented in this handbook in section 7.3 (preferred option);
- 2. Identify the mass breakdown of the instrument according to the following categories and use it to scale the respective LCI in the database (...)

LCA Tailoring Tailoring specification

- Define System Boundaries, Environmental impact categories, etc
- Define equipment LCI data collection approach

LCA Data collection approaches

- *Equipment*

Approach A

Dedicated LCA
supplier
questionnaires

→ LCA data questionnaire template is cascaded to equipment suppliers via SoW

Approach B

Equipment
documentation
(ESA standards)

→ Internal review of supplier design documents

Approach C

Reuse of LCA
supplier
questionnaires

→ Assess similarity, reuse LCI data / LCA models from past projects

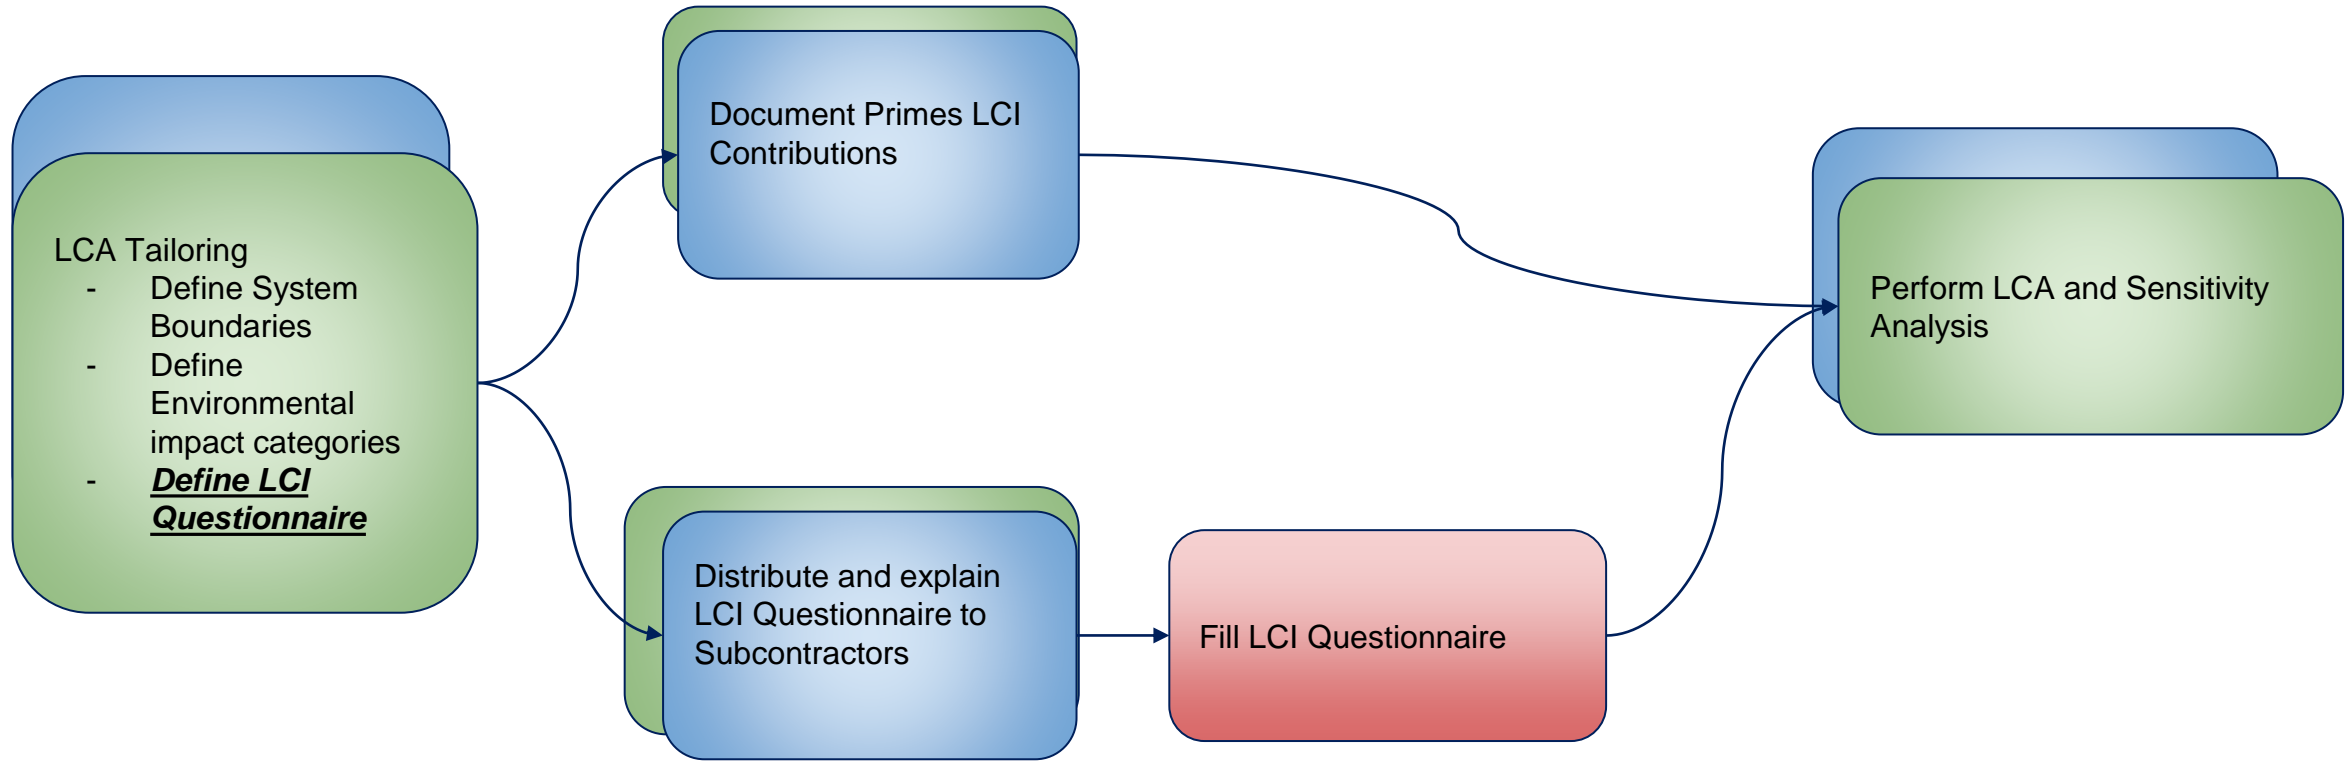

Dedicated LCA
supplier
questionnaires

LCA Data Collection - **equipment**

Approach A:

Dedicated LCA supplier Questionnaires

Process Flow in Airbus - Approach A

Remark: Each step is established in iterations

LCI Questionnaires

- The Questionnaire approach overall is considered good for Equipment LCA data collection.
- Harmonisation towards an ESA standard is highly welcome, in order to avoid duplication of efforts on SubCos side.
- The Questionnaire has to be as **simple and pragmatic** as possible accompanied by clear guidelines. Currently SubCos have major difficulties to fill it. The data received is very inhomogeneous.
- Proposed to have more specific and simpler questionnaires in the future, *dedicated to equipment type*. This will allow to give better and simpler guidance to the SubContractors.

LCI Questionnaires con't

- Proposed Categories for LCI Questionnaires:
 - Electronic Unit (PCDU, STR,GNSS, MAG, RIU, OBC, MMFU)
 - Simple and Small Unit (CESS, CSS, MTQ, ...)
 - Batteries
 - Solar Array
 - Mechanical Systems (Structure)
 - Propulsion Subsystem
 - Harness
 - Passive Thermal Hardware (MLI)
 - EGSE+OGSE
 - MGSE
 - Satellite Environmental Tests
 - For Major Payloads , an approach similar to the Prime input to LCA might be necessary

LCI Questionnaires con't

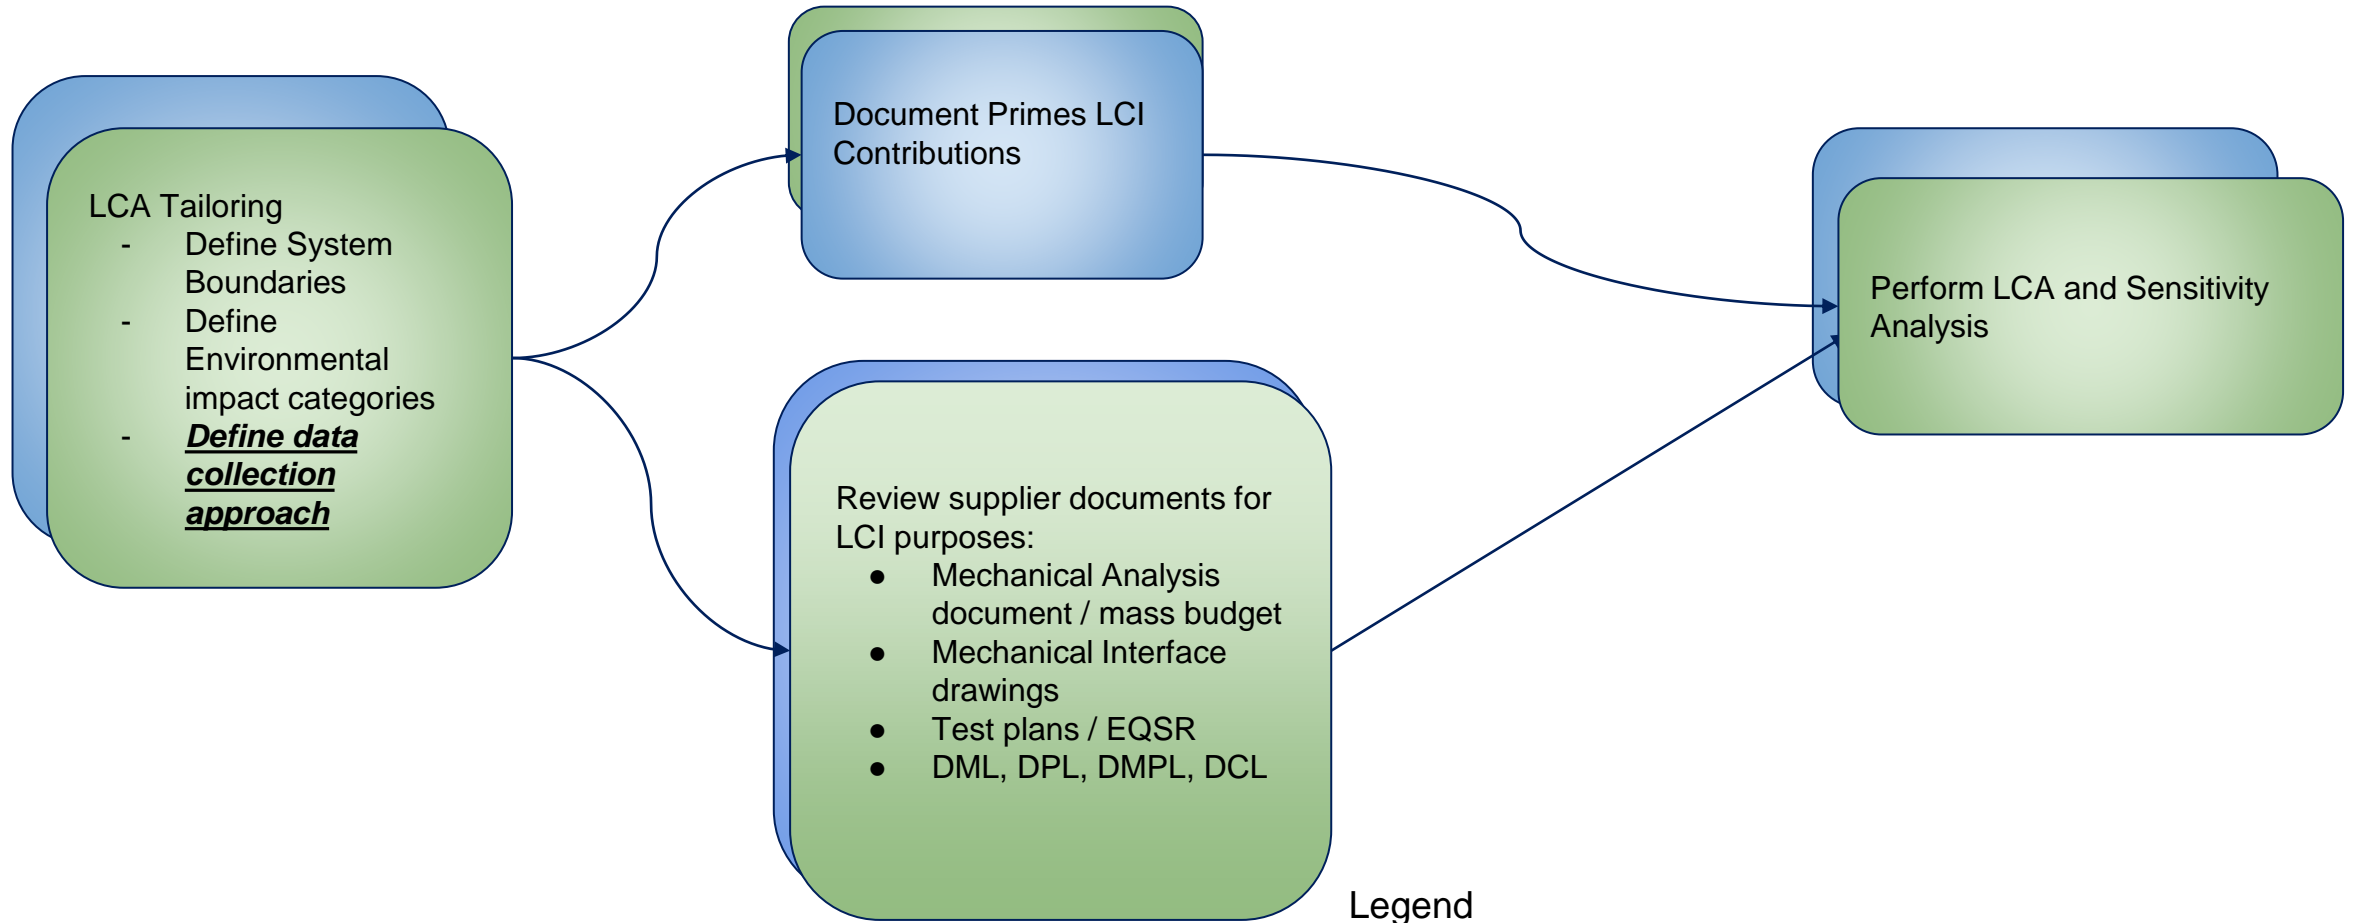

- Difficulties encountered in LCI :
 - In many cases the relevant manufacturing steps are at external suppliers (tier 2) in a “build to print” approach. (e.g.PCB production, Housing manufacturing, Panel production, ...). It would be major cost driver (if not impossible) to roll-out the LCA requirements to this level.
 - DML and DPL might be used, they are however more focused on manufacturing quality not very useable for LCA.
 - The above problems are even more pronounced for EGSE, where the SubCos do mainly integration and functional testing of “COTS” units.

LCA Data Collection – **equipment**

Approach B

Usage of Standard Equipment Documentation

Process Flow in Airbus - Approach B

Remark: Each step is established in iterations

Equipment documentation (ESA standards)

- Mass budget level of details varies significantly in between equipment/suppliers. The necessary level of detail is known but not displayed in a consistent manner across documents. Possibility to improve/harmonise mechanical analysis document requirements and its link to the DML, capitalising on very good work already in place.
- Accuracy of mass estimations in DML do not allow to derive a consistent LCI, preventing a accurate mass repartition across DML, DMPL and DCL.
- DML makes no reference of waste generated nor all consumables.
- DML, DPL, DMPL and DCL are not created for GSE.
- DPL information could be used based on a dedicated data collection exercise targeting environmental flows of key processes such as surface treatments, pre-pegs and other requiring use of oven, etc.

Equipment documentation (ESA standards)

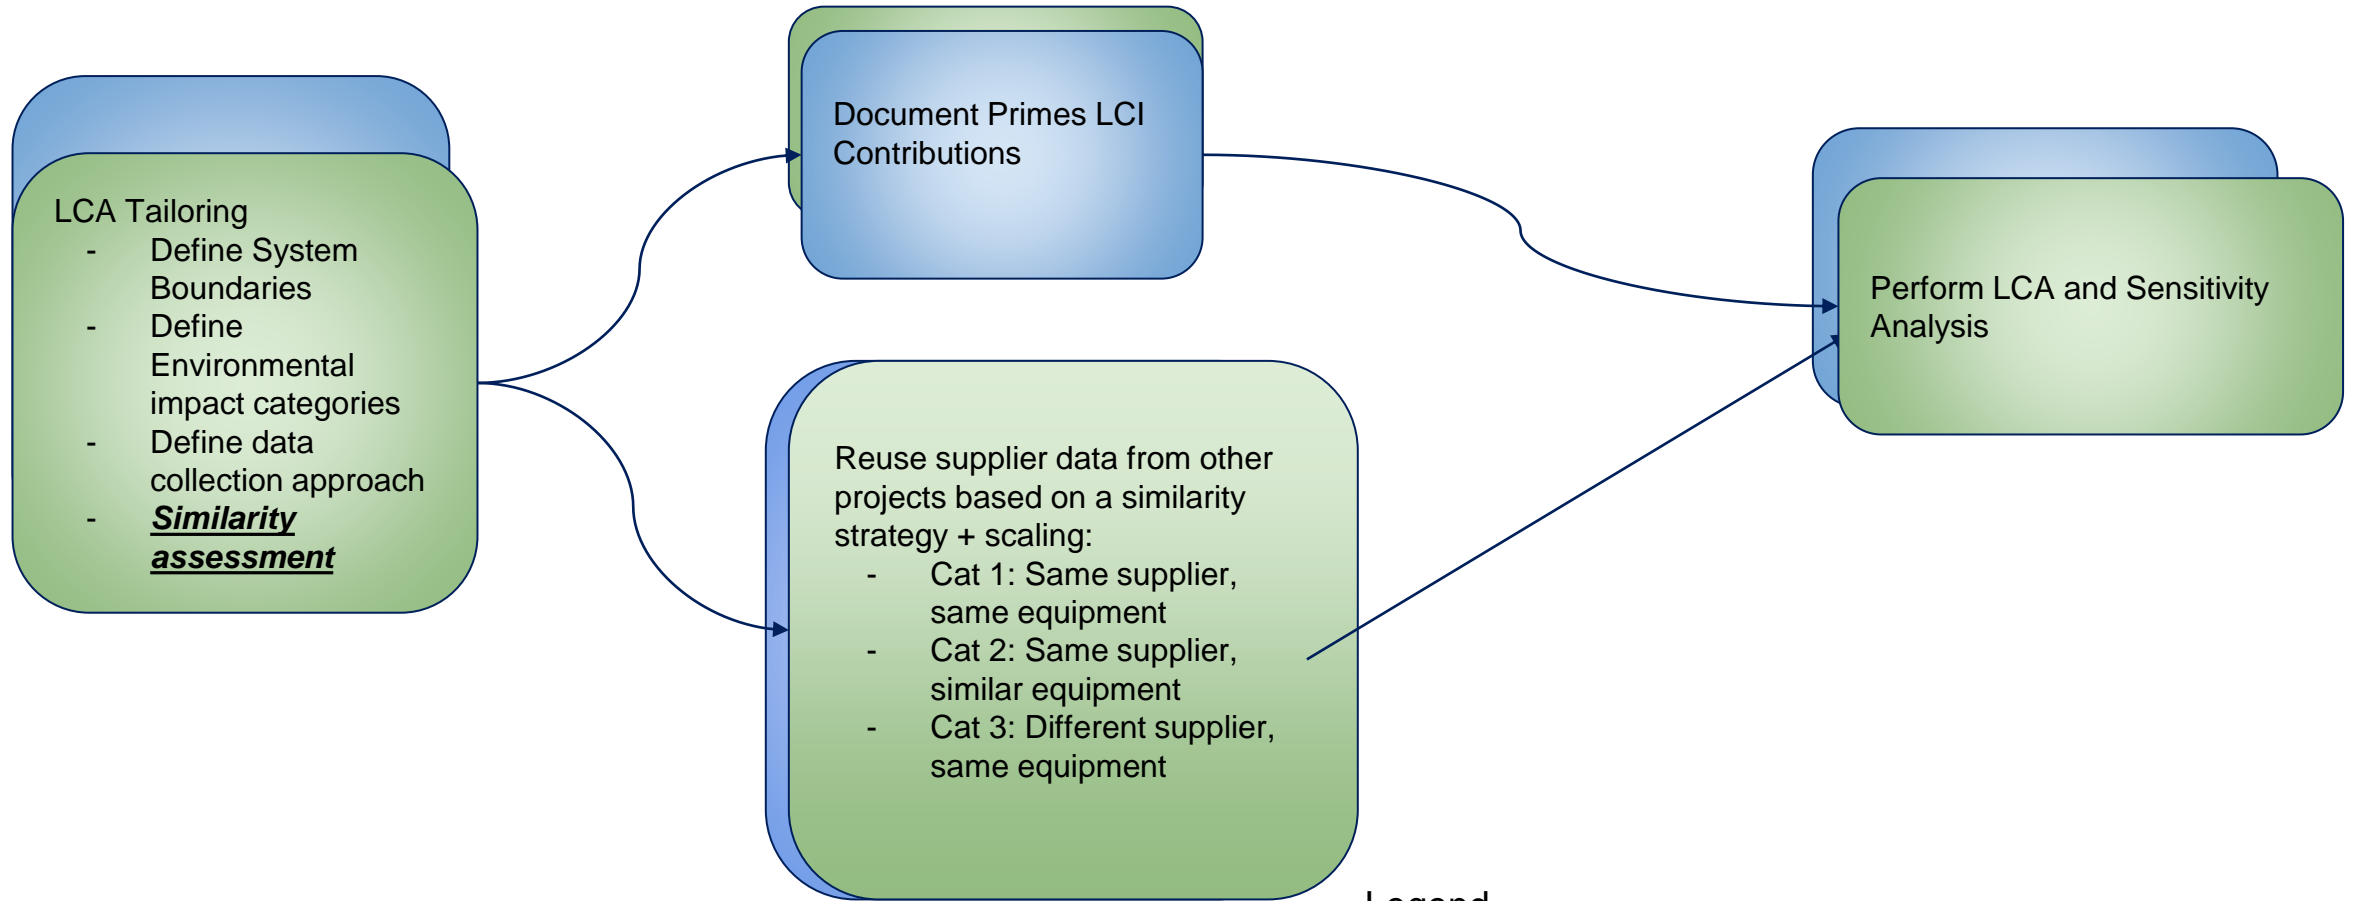

- Potential to avoid work duplication, by capitalising on existing documents
- Equipment team involvement is minimised
- Consistent approach in LCI compilation, which is performed by one single team
- Mass repartition using this approach has proven consistent with the approach A (i.e. when dedicated LCI supplier data is made available)
- Possibility to pre-fill LCI supplier data questionnaire
- Expert estimation/validation could be required for aspects such as:
 - environmental testing profile
 - repartition between type of electronic components
 - share of standard parts in the structural parts overall mass
- Efforts in accounting for radiative surface/paint, standard parts, conformal coating, proven not efficient - low sensitivity of results.

LCA Data Collection – **equipment**

Approach C

Reuse of LCA supplier questionnaires

Process Flow in Airbus - Approach C

Remark: Each step is established in iterations

Data collection using a equipment similarity strategy

- 3 similarity categories:
 - Cat 1: Same supplier, same equipment
 - Cat 2: Same supplier, similar equipment
 - Cat 3: Different supplier, same equipment
- Mass scaling proved effective when compared with supplier data (mass budget).
- Overall potential to be validated by DQR.

Reuse of LCA
supplier
questionnaires

Summary

Approach A

- Good approach.
- Significant effort in advising, training and coordinating equipment supplier.
- Need for further simplification.

**Dedicated LCA
supplier
questionnaires**

Approach B

- Potential to avoid work duplication if document standards were to be harmonised (ECSS)
- Significant effort from both the Satellite and the LCA teams to review inhomogeneous sources of data.

**Equipment
documentation
(ESA standards)**

Approach C

- Efficient approach, valid as a complementary approach to A or B.
- Calls for optimisation strategy for supplier data collection.

**Reuse of LCA
supplier
questionnaires**

LCI improvement possibilities

LCI improvement possibilities

- Define standard on how to report technical data relevant for LCA purposes, eg: mass budget.
- Build library for DCL entries - automated analysis that could significantly improve DQR on electronics boards.
- Focus supplier LCA data collection on processes, testing, key substances. Complement with validation of pre-filled mass budget.
- Specific and simpler questionnaires in the future, dedicated to equipment type.
- Reuse of equipment LCA models provided by ESA, while focusing equipment supplier data collection on mission specific elements.
- Define strategy for reuse of supplier data collection.
- Use the approaches described in a complementary arrangement.

Outlook

- Finish the ongoing LCA to have **complete** Satellite LCA Models
- Cross Check the Results comparing approaches across the different projects
- Perform Sensitivity Analysis to distinguish the areas where more precise data would impact the overall result
- Perform selected bottom up studies to calibrate the LCA results, starting with the most impacting and/or most typical elements
- Continue to seek ways how to simplify specific LCI data collection, it is difficult to our subcontractors

Q&A

Thank you
