PDB files - atomistic representation

- Protein Data Bank files :

- A way to **store** and **exchange** polyatomic structures (proteins, **DNA**)
- File describing the **3D structural information** of molecules
- A **worldwide free access** to files obtained experimentally by crystallography techniques or computed with geometry optimization codes

<http://www.rcsb.org/>

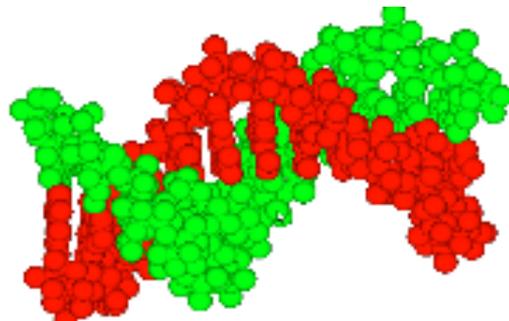

- File format :

- ASCII file ‘.pdb’
- We mainly extract information from **ATOM** keyword

```

Integration into Geant4 (1/2)

- Pdb4dna example will be provided in the next Geant4 release 10.1

Integration into Geant4 (2/2)

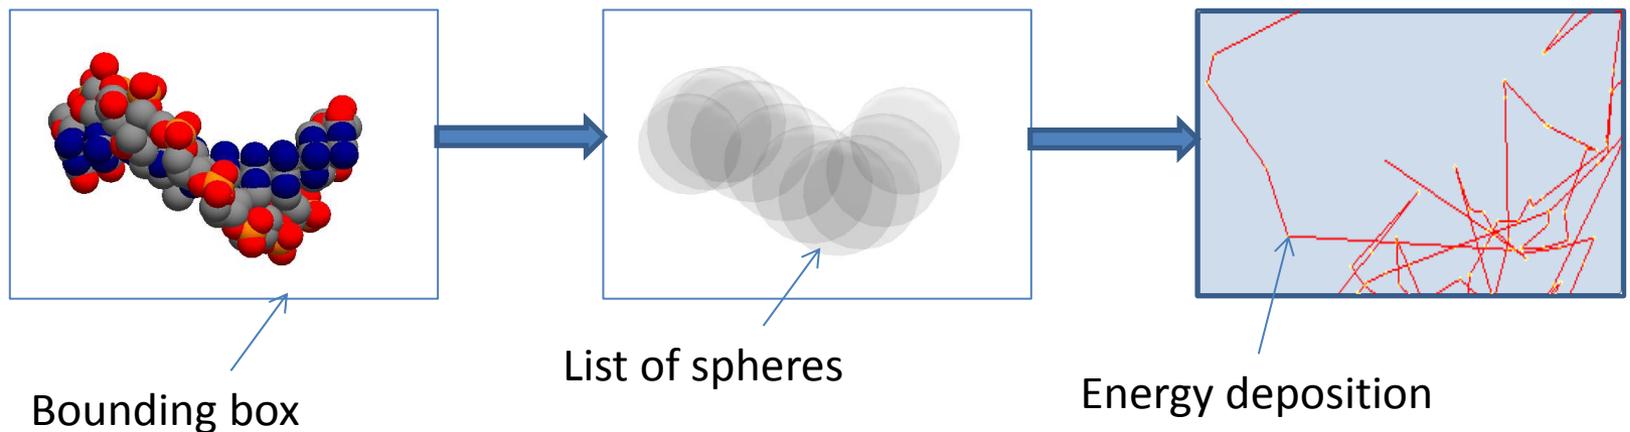

- **DetectorConstruction** call PDBlib to construct molecule geometry
- **EventAction** compute match between Edep and DNA via Detector construction

Algorithm to find the closest atom 1/2

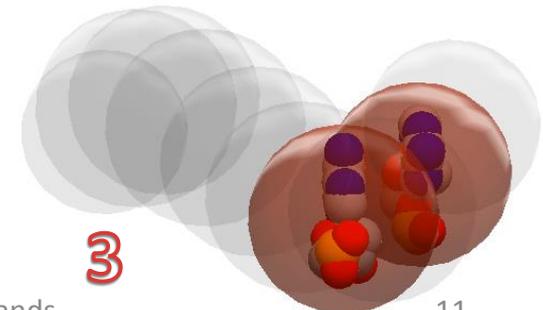

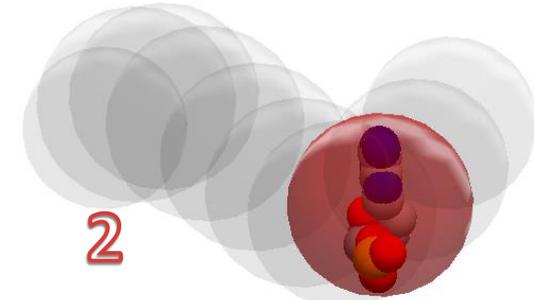

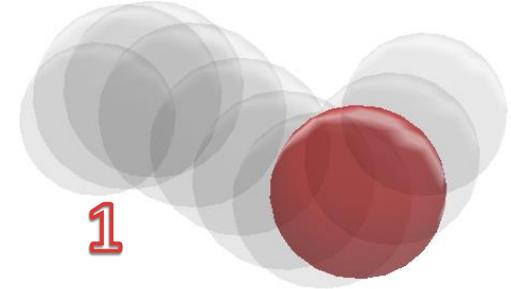

Goal = allocate **energy depositions** to an **element** [sugar, phosphate, base] of nucleotides and then deduce SSB and DSB

- A **bounding box** is calculated with atoms coordinates
- No other Geant4 solid is needed for simulation
- We consider that a sphere is a good approximation to englobe a nucleotide. A **list of spheres** representing nucleotides is calculated
- DNA specific

Algorithm to find the closest atom 2/2

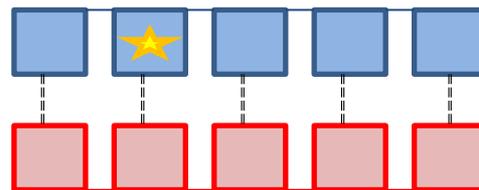

- **1**: Find the closest **nucleotide** from the energy deposition inside the two strands
- **2**: Find the closest **atom** from the energy deposition
 - atom by atom inside the selected nucleotide
 - considering Van der Waals radii
- **3**: Due to sphere overlapping, find a better match in the next two nucleotides in the list
- **4**: Return algorithm response:
 - No DNA hit
 - DNA hit, return **nucleotide ID**, **DNA strand**, **group type** (sugar, phosphate or base)

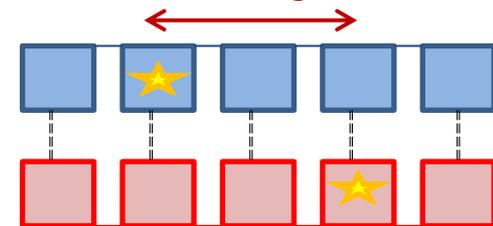

Strand breaks

- Begin of event:
 - A **map** for each strand is created to **store** nucleotide ID and associated energy deposition
- For each step:
 - If the step is in the bounding volume, increment energy deposition per event
 - Ask to PDBlib to **check** the step **position**
 - If the step is in a sugar or a phosphate: get nucleotide ID, strand number, energy deposit, **update** the **map** (ID, Edep+=StepEdep)
- End of event:
 - **Compute** and store **strand breaks**
 - Store energy deposit in the bounding volume

Edep > threshold in sugar-phosphate to get a SSB

Distance between 2SSB > distance to get a DSB

Preparation before run (1/3)

Visit Protein Data Bank website → <http://www.rcsb.org/>

The screenshot shows the RCSB Protein Data Bank website homepage. The browser address bar displays www.rcsb.org/pdb/home/home.do. The page features a navigation menu with options like Home, Deposition, Education, News, Tools, Help & Contact Us, and More. A search bar is prominently displayed with a search button and a magnifying glass icon. Below the search bar, there are tabs for 'Everything', 'Author', 'Macromolecule', 'Sequence', and 'Ligand'. The main content area is titled 'Biological Macromolecular Resource' and includes a 'Full Description' section. This section contains several featured articles, such as 'Molecule of the Month: Ebola Virus Proteins' and 'Protein Structure Initiative Featured System: Deciphering Microbial DUFs'. There are also links to 'Full Article' and 'Archive' for these articles. A mobile app section is visible, indicating that the PDB is supported on iOS and Android platforms. The right sidebar contains a 'Customize This Page' section with a 'New Features' button and a 'Latest release: August 2014' announcement. Below this, there are links to 'RCSB PDB News' and a 'Comparison Tool for Exploring Sequence and Structure Alignments'. The bottom of the page shows a Windows taskbar with various application icons and a system tray displaying the time as 17:46 on 28/10/2014.

Structural View of Biology

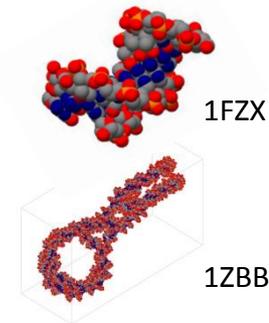

List View of Archive By: Title | Data

For the tutorial, we look at:

1FZX file : 12 bp DNA strands (run with GUI)

1ZBB file : dinucleosome (run in batch mode)

(Note that for the tutorial, those PDB files are provided in the pdb4dna directory)

« Do you know **1AOI.pdb**? »

Preparation before run (3/3)

The screenshot shows the RCSB Protein Data Bank website for entry 1FZX. The page is titled "NMR SOLUTION STRUCTURE OF THE DNA DODECAMER GGCAAAAACGG". The primary citation is "Solution structure of an A-tract DNA bend." by MacDonald, D. P., Herbert, K. P., Zhang, X. P., Pologruto, T. P., Lu, P. P. (2001) J.Mol.Biol. 306: 1081-1098. The abstract describes the NMR solution structure of a DNA dodecamer d(GGCAAAAACGG)/d(CCGTTTTTGGCC) containing an A-tract. The structure is characterized by decreasing minor groove width from the 5' to the 3' direction along the A strand. The four central thymine bases all have negative inclination throughout the A-tract with an average value of 6.1 degrees. The proton on N6 of adenine and the O4 of thymine one step down the helix are within distance to form bifurcated hydrogen bonds. The 5' bend of tilt and roll, 10 degrees, occurs in two base steps: the first composed of tilt, -4.1 degrees, and the second a combination of tilt and roll, 10 degrees, occurs in two base steps: the first composed of tilt, -12 degrees, and the next base, a guanine, which has 3 degree formation of a hydrogen bond between the protons of N4 of the 3' cytosine and the O6 of the next 3' base, a guanine, stabilizing the roll comparison, we also determined the structure of the control sequence, d(GGCAAGAAAACGG)/d(CCGTTTCTGGCC), with an AT to GC transition in A-tract, resulting in a bend of only 9 degrees. When ligated in phase, the control sequence has nearly normal mobility in gel electrophoresis.

Keywords: Autoradiography, Base Pairing, Computer Simulation, DNA, Bacterial, Hydrogen Bonding, Models, Molecular, Models, Theoretical, Nucleic Acid

Related Structures: Primary Citation of 1FZX - 1024

The 'Download Files' menu is open, showing options: FASTA Sequence, PDB File (Text), PDB File (gz), mmCIF File, mmCIF File (gz), PDBML/XML File, PDBML/XML File (gz), NMR Restraints (Text), NMR Restraints (gz), and V2 NMR Restraints (gz). The 'Structure Image' section shows a 3D ribbon model of the DNA dodecamer.

Run in GUI (1/4)

Due to GUI limitation, if you want to select a file into open file dialog you need to rename the extension from pdb to mac.

```
$ cp file.pdb file.mac
```

Run GUI

```
$ ./pdb4dna
```

Be careful, the command will change in the next release to: `./pdb4dna -gui`

Session :

Run in GUI (2/4)

Load PDB file (.mac)

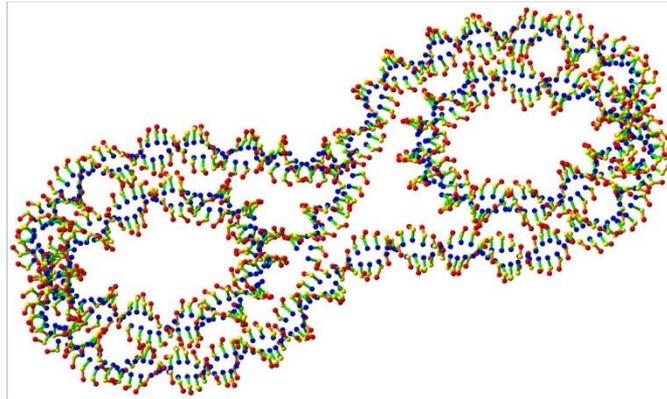

Click on 'Draw' menu, and Try different visualisation...

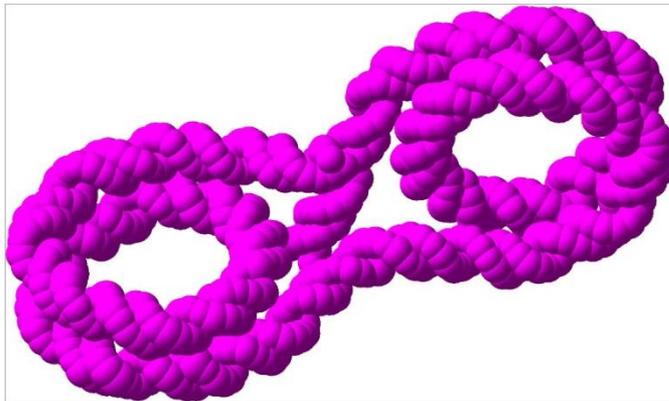

Run in GUI (3/4)

Those screenshots correspond to 1ZBB.pdb (.mac)

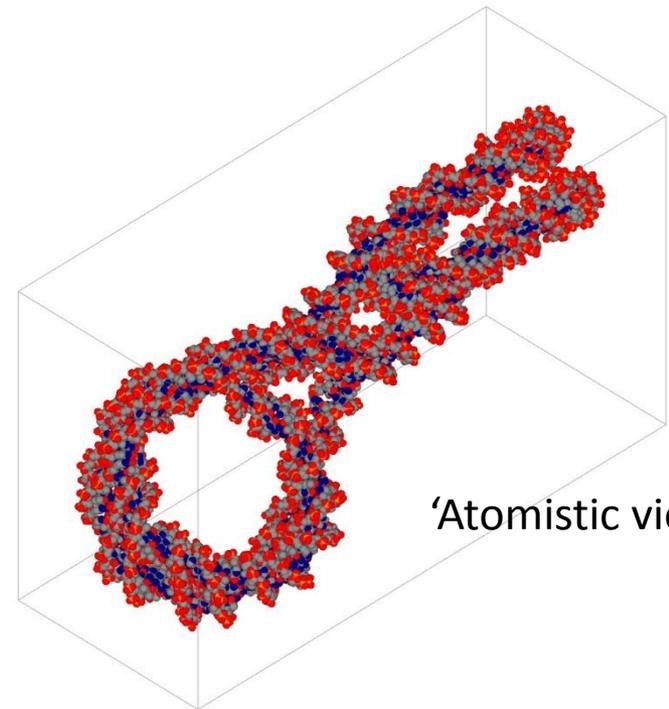

Visualization of a di-nucleosome (Asymmetric Unit of a tetra-nucleosome)

'Residue view'

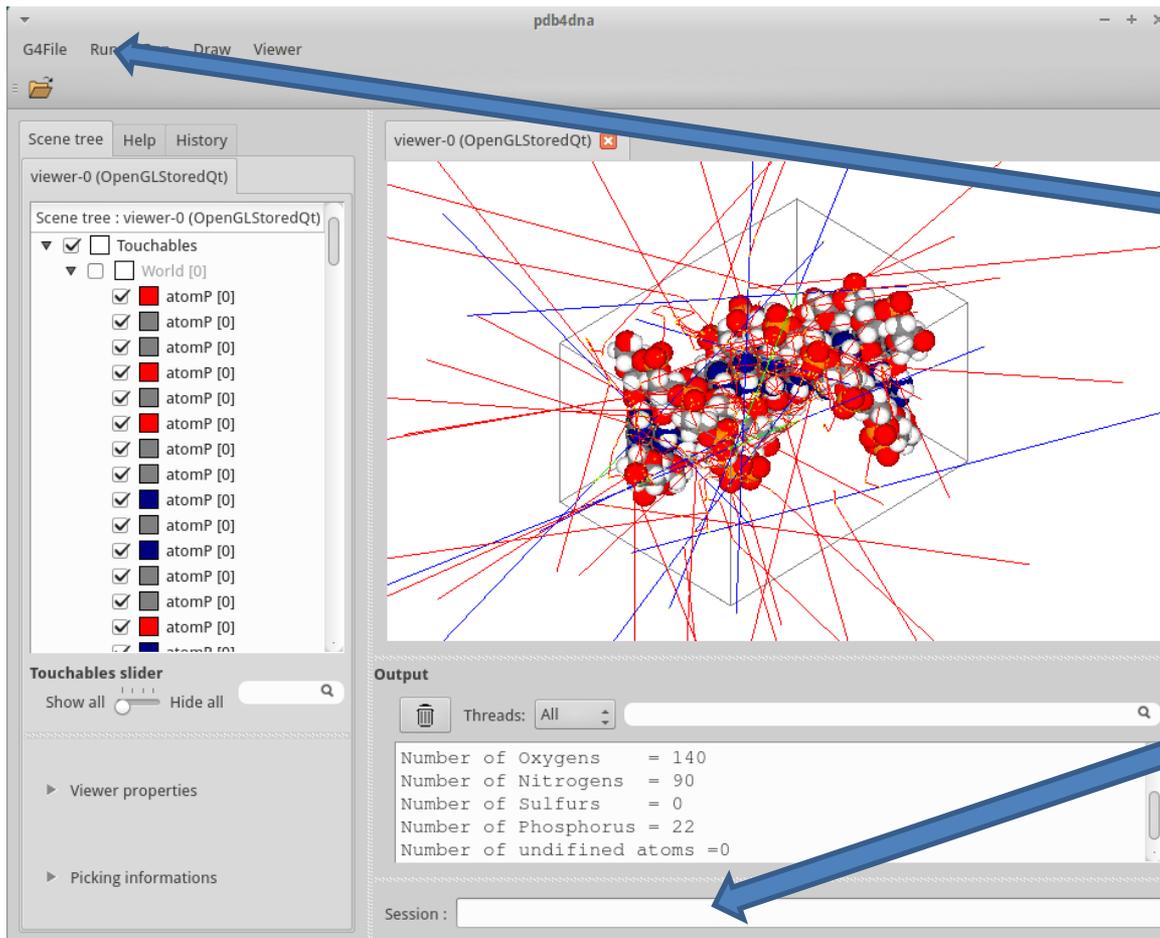

'Barycenter view'

'Atomistic view'

Run in GUI (4/4)

Launch a simulation configured by 'runInGUI.mac' in the Run menu

Call run and gun commands in the session text box

```
/gun/particle e-
/gun/energy 10 keV
/run/beamOn 10
```

...

Run in batch mode (1/2)

1. Prepare your macro file “tutorial.in” using your favorite editor (geany...)

You can start from the “pdb4dna.in” macro file

```
tutorial.in
/run/initialize

/PDB4DNA/det/loadPDB 1ZBB.pdb
/PDB4DNA/det/buildBoundingV

/PDB4DNA/event/setEnergyThres 8.22 eV
/PDB4DNA/event/setDistanceThres 10

/gun/particle proton
/gun/energy 1 keV

/run/initialize
/run/beamOn 10000
```

Select your PDB file

Construct the bounding volume

Set thresholds for strand breaks: energy, distance

Set characteristics of primaries

Initialize and run the simulation

Run in batch mode (2/2)

2. Run the simulation

```
$ ./pdb4dna -m <your_macro_file> -t <number of threads>
```

Be careful, the command will change to:

```
./pdb4dna -mac yourmacrofile -mt numberofthread
```

```
$ ./pdb4dna -m tutorial.in -t 2
```

```
