ESA Open Source Software Repository

Presenter: Robert Blommestijn (ESA)

ESA has the obligation to distribute its Intellectual Property (IP) items, in particular software, be it open or closed source. In order to facilitate the distribution to users, a Repository has been developed that can host software or documents. This web-based tool implements the processes that have been defined according to the licensing principles: explicit registration and verification of users, appropriate license definition and acceptance, targeted distribution of IP.

The presentation will describe the tool that has been developed and will give plans for his future deployment.
